Correspondence to Professor Tom Bourne; t.bourne@imperial.ac.uk **Objective** Assess experience of healthcare professionals (HCPs) working with ultrasound in obstetrics and gynaecology during the evolving SARS-CoV-2 pandemic, given the new and unprecedented challenges involving viral exposure, personal protective equipment (PPE) and well-being.

Design Prospective cross-sectional survey study. **Setting** Online international survey. Single-best, open box and Hospital Anxiety and Depression Scale (HADS) questions.

Participants The survey was sent to 35 509 HCPs in 124 countries and was open from 7 to 21 May 2020. 2237/3237 (69.1%) HCPs from 115 countries who consented to participate completed the survey. 1058 (47.3%) completed the HADS.

Primary outcome measures Overall prevalence of SARS-CoV-2, depression and anxiety among HCPs in relation to country and PPE availability.

Analyses Univariate analyses were used to investigate associations without generating erroneous causal conclusions.

Results Confirmed/suspected SARS-CoV-2 prevalence was 13.0%. PPE provision concerns were raised by 74.1% of participants; highest among trainees/resident physicians (83.9%) and among HCPs in Spain (89.7%). Most participants worked in self-perceived high-risk areas with SARS-CoV-2 (67.5%-87.0%), with proportionately more trainees interacting with suspected/confirmed infected patients (57.1% vs 24.2%-40.6%) and sonographers seeing more patients who did not wear a mask (33.3% vs 13.9%-7.9%). The most frequent PPE combination used was gloves and a surgical mask (22.3%). UK and US respondents reported spending less time self-isolating (8.8 days) and lower satisfaction with their national pandemic response (37.0%-43.0%). 19.8% and 8.8% of respondents met the criteria for moderate to severe anxiety and depression, respectively.

Conclusions Reported prevalence of SARS-CoV-2 in HCPs is consistent with literature findings. Most respondents

Strengths and limitations of this study

- Strengths of our study include the sample size, the assessment of healthcare professional (HCP) responses internationally and the ability to compare responses between different HCPs.
- Four languages enabled greater participant inclusion, and responses between International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) and non-ISUOG members were compared prior to grouping for analysis.
- Key weaknesses include possible selection bias due to the method of sample selection and the low population response rate.
- It is important not to draw conclusions about causation as this is a descriptive study performed as the pandemic was evolving.
- At the time of survey participation, the majority of HCPs did not have the same access to a swab or antibody test that is now available.

used gloves and a surgical mask, with a greater SARS-CoV-2 prevalence compared with those using 'full' PPE. HCPs with the least agency (trainees and sonographers) were not only more likely to see high-risk patients but also less likely to be protected. A fifth of respondents reported moderate to severe anxiety.

INTRODUCTION Background

The SARS-CoV-2 pandemic has caused unprecedented challenges to all healthcare systems.¹ These include patient protection, managing the burden of disease on service capacity and mitigating adverse effects on healthcare professionals (HCPs: physicians, sonographers, nurses and allied HCPs).²

Guidance has internationally focused on clinician redeployment to front-line settings, prioritisation of services, provision and rationalisation of personal protective equipment (PPE).³⁴ During the pandemic, access to PPE for HCPs has remained a key concern. Despite HCPs being prioritised in most countries, PPE shortages have been described universally¹ and have been a particular concern in the early months of the pandemic. Lack of sufficient and adequate PPE is important in obstetrics and gynaecology, where HCPs work in a variety of settings, including ultrasound scanning, may not ordinarily be considered high-risk but involves close patient proximity for extended periods.⁵ These areas are easily overlooked but may pose a high risk of SARS-CoV-2 infection.⁶

A further concern has been the availability of SARS-CoV-2 testing among HCPs. Initially, provision for this was variable, with, for example, relatively easy access in Hong Kong compared with virtually none in the UK. This is important as, in the absence of testing, HCP risk becoming COVID-19 vectors within hospitals and the wider community. Lack of testing may also lead to unnecessary isolation from work. There are limited data regarding HCP testing availability and time HCPs have taken off work due to suspected or confirmed SARS-CoV-2.⁷

Less attention has been focused on the implications of infectious diseases on HCP psychological health, which previous pandemics have shown to be significant.⁸ ⁹ HCPs are confronted with ongoing resource, shift pattern, PPE and testing uncertainty,¹¹⁰ as well as COVID-19 exposure risk and the implications of this on their families.¹¹ Protecting the psychological health of the medical workforce is critical, particularly as anxiety, depression and burnout are recognised complications for HCPs working in high-stress environments.¹²

Objectives

We aimed to assess the scale, experience and psychological well-being of clinicians who have experienced the evolving SARS-CoV-2 pandemic working with ultrasound in obstetrics and gynaecology internationally between 7 and 21 May 2020.

METHODS

Study design

We used a cross-sectional survey design with two main sections assessing physical aspects, including underlying medical conditions, comorbidities and personal SARS-CoV-2 experience, and psychological well-being (online supplement 1: The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) SARS-CoV-2). Participants were initially asked to provide informed consent prior to continuing to the online survey. If they did not give consent by answering 'yes' to the first question, they were not directed to the survey. Single-best answer and open box questions were proposed by a senior gynaecologist. These were then piloted, vetted and modified by the authors before being translated from English to French, Spanish and Italian in order to increase survey accessibility. We estimated that the time taken to complete the questionnaire was 10 min.

Setting

The online platform SurveyMonkey (2020) was selected to upload and disseminate the questionnaire, which was encrypted, and multiple responses were disabled. The survey design ensured the data collected was completely anonymous for all respondents.

Participants

All HCPs on the International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) mailing list were invited to participate in this study between 7 and 21 May 2020. There were 1237953 confirmed cases of SARS-CoV-2 infection and 63313 deaths in the time the survey was open.¹³ Various countries had instigated local and national lockdowns at this time, including the UK. Members were sent an email containing information describing the study and individual links to the questionnaire in English, Spanish, Italian and French. We made it clear to the participants that their participation was voluntary and that responses would be both anonymous and untraceable.

During the survey period, two reminders were sent out. As this was a survey study of a relatively new condition at the time, a power calculation was not performed. Exclusion criteria included retired doctors as this was deemed to not be reflective of the working environment during the SARS-CoV-2 pandemic. A copy of the questionnaire in English can be viewed in online supplement 1: The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) SARS-CoV-2.

Patient and public involvement statement

Given the HCP participant population and the acute nature of the SARS-CoV-2 pandemic, patient and public involvement was not performed.

Variables and data sources

Physical aspects

This section was divided into subsections: Introduction; Demographics; Underlying medical conditions; Medications; Smoking and BMI; Role, shift pattern, PPE; SARS-CoV-2 diagnosis; Personal SARS-CoV-2 pathway; Household; Colleagues; and Support (online supplement 1: The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) SARS-CoV-2: questions 2–40).

Participants were asked details about their job and organisational attributes, as well as on a variety of personal comorbidities relevant to SARS-CoV-2 infection.¹⁴ They were then questioned on their personal experience of SARS-CoV-2 at home and in the workplace.

Psychological well-being - Hospital Anxiety and Depression Scale (HADS)

Participants were given the option to complete the validated HADS, which is a 14-item (seven questions related to anxiety and depression each) questionnaire¹⁵ (online supplement 1: The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) SARS-CoV-2: questions 41–56). Each subscale measures symptom severity (the score ranges between 0 and 21, a score greater or equal to 11 indicates moderate-to-severe symptoms). If respondents chose not to complete the HADS, the survey ended.

Outcome measures

The primary outcome was the overall prevalence of SARS-CoV-2, depression and anxiety among HCPs in relation to country and PPE availability.

Statistical analyses

Univariate analyses were used to investigate the association between country of origin, type of HCP and PPE without generating erroneous causal conclusions. Results were presented as percentages (%), mean, 95% CIs, medians and ranges, depending on the variable. Missing data, that is, questions that were skipped by HCPs as they completed their questionnaire, were not included in the analyses.

HCPs and areas of work were divided into groups to allow reasonable comparable analyses to be performed. For HCPs, there were three main categories: consultants/attending physicians (gynaecologists, obstetricians, obstetricians and gynaecologists or radiologists/ sonologists aged 35 years and older); trainees/residents (gynaecologists, obstetricians, obstetricians and gynaecologists or radiologists/sonologists aged 34 years and younger, doctors in research and doctors in training); and sonographers (sonographers and allied HCPs (midwives and nurses)) (online supplement 3: Breakdown of healthcare professional (HCP) roles for analysis).

Areas of work were defined as high-risk (gynaecology (early pregnancy unit, acute gynaecology and ultrasound), obstetrics (birth centre/birthing centre, labour ward, maternity triage/hospital obstetric triage and ultrasound) and radiology (sonology–ultrasound)); moderate risk (obstetrics (antenatal clinic, antenatal ward, community clinics and postnatal ward) and radiology (non-ultrasound)); or low-risk (working from home, gynaecology (benign and oncology) and obstetrics (maternity helplines)) (online supplement 4: Breakdown of risk by area of work for analysis). This categorisation approximated risk based on HCP proximity and time spent with patients, allowing meaningful data analysis.

Anxiety and depression scores were divided by caseness in order to differentiate the proportion of the study population that had no anxiety or depression (HADS score 0–7), those experiencing mild anxiety or depression (HADS score 8–10), and those suffering from moderateto-severe anxiety or depression (HADS 11–21).

The statistical analyses were performed using R V.3.5.1.

RESULTS Summary Response

The survey was sent to 35 509 HCPs in 124 countries. A total of 3287 (9.3%) HCPs clicked the survey link and 3237 (98.5%) of them consented to complete it. A total of 1960 (60.5%) responded in English, 881 (27.2%) in Spanish, 267 (8.2%) in Italian and 129 (4.0%) in French. The response rate for ISUOG members was 23.1% (2441/10589), while that for non-ISUOG members was 3.2% (796/24920) (online supplement 5: Flowchart summarizing survey participants, differentiating International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) members and non-ISUOG members (n = 3287)). Of 3237 HCPs from 115 countries who started the survey, 2237 (69.1%) completed it in full. Mean age of respondents was 47.2 years, with a range from 18 to 82 years. The majority (83%) were aged 31-60 years old. A total of 1474 (66%) of respondents were female and 755 (34%) were male, with 4 intersex or undisclosed. Of 2237 participants, 1058 (47.3%) completed the HADS, and the remainder (1179/2237, 52.7%) did not. Survey participation and demographics are summarised in table 1.

Direct comparison of data between the characteristics of ISUOG members and non-ISUOG members confirmed findings were similar (online supplement 6: Demographics of survey participation, differentiated based on International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) membership (n = 3237)). It was therefore deemed appropriate to combine these populations for the analysis.

COVID-19 prevalence

Confirmed or suspected SARS-CoV-2 prevalence was 13.0% (290/2237). Among this group, 11.4% had a history of heart/lung disease; 13.4% were taking antihypertensives; and 4.5% were smokers (online supplement 7: Comparison of comorbidity in those with (n = 290) and without suspected or confirmed SARS-CoV-2 (n = 290) (Total n = 2237)).

PPE use and provision

Of all HCPs, 12.5% reported not using PPE, while 87.5% reported variable use. Of the total HCPs, 74.1% had concerns about provision or shortages of one or more items of PPE, in particular N95/FFP3 masks (57.2%). PPE was reported to be recycled or reused by 61.3%.

Anxiety and depression

Of the total participants, 21.6% met the criteria for mild anxiety, and 19.8% met the criteria for moderate-tosevere anxiety; 19.4% met the criteria for mild depression and 8.8% for moderate-to-severe depression. Of those with suspected/confirmed SARS-CoV-2, 27.2% and 12.3% reported moderate-to-severe anxiety and depression, compared with 18.4% and 8.1% of those without (online supplement 8: Comparison of Hospital Anxiety and Depression scale (HADS) scores in those with (n =

162) and without suspected or confirmed SARS-CoV-2 (n = 896) (Total n = 1058)). A greater proportion of female participants scored for moderate-to-severe anxiety (156/754, 20.7%) and depression (79/754, 10.5%) compared with male participants (41/303, 13.5% and 14/303, 4.6%) (online supplement 9: Hospital Anxiety and Depression scale (HADS) breakdown by gender (n = 1058)).

Four out of 2237 participants were excluded from the univariate analyses, having completed the survey following retirement.

Univariate analysis by country (N=2233)

A breakdown of findings by countries that had most respondents is presented in table 2.

COVID-19 prevalence

The highest prevalence of SARS-CoV-2 infection based on symptoms and/or a positive PCR swab was reported in the UK (31.1%), followed by Italy (14.9%), Spain (14.7%) and the USA (13.7%). Respondents from India and the Philippines reported a prevalence of 2.6% and 8.8%, respectively. Only 0.9% and 1.0% of Indian and UK participants, respectively, had an antibody test, compared with 52.9% and 60.3% of participants in Italy and Spain, respectively. Of participants from the USA and Spain who had a SARS-CoV-2 antibody test, 25.0% and 13.4%, respectively, had a positive result.

Participants in the UK reported spending an average of 8.8 days self-isolating away from the workplace, the same as those in the USA. Mean self-isolation time was only

greater than 2 weeks in India and in the Philippines (17.3 and 16.9 days, respectively), where SARS-CoV-2 prevalence among HCPs in the study was lowest at the time of the study.

PPE use and provision

The use of PPE when performing ultrasound was reported by 73.0%-95.1% of participants. The most common combination of PPE used while performing ultrasonography was gloves and a surgical mask, with the highest rates of use in Italy (45.4%), the UK (39.8%) and the USA (44.1%). No participants from the Philippines and only 6.1% from India reported using only gloves and a surgical mask. Visor use, in addition to gloves and a surgical mask, was highest in the UK (16.5%) and the USA (11.8%). Full PPE (gloves, FFP3/N95 mask, visor, gown and surgical hat) was used by 4% (90/2233) of the respondents. Full PPE use was highest in the Philippines (20.2%) and lowest in the UK (0%). Apart from the UK (32.0%), high rates of patients wearing a mask were noted in every other country analysed (80.0%-99.4%).

PPE provision or supply concerns were highest in Spain (89.7%), Italy (79.9%) and the Philippines (82.5%), and lowest in the UK (55.3%) and India (54.8%). Less PPE was reported as being recycled or reused in the UK (39.8%) compared with any other country analysed. In the USA, 88.2% of HCPs reported PPE recycling or reuse.

Anxiety, depression and support

The HADS revealed that in the UK, 22.6%, and in the USA, 27.1% of participants met the criteria for moderate to severe anxiety, higher than any other country analysed, with Spanish participants having the lowest rate (14.3%). Italian, UK and 'other countries' participants had the highest rates of moderate to severe depression (9.6%–9.7%), with Philippines HCPs having the lowest rates (2.8%).

Levels of satisfaction with the support offered by local units during the pandemic ranged from 68% to 78% in all countries except Italy, where the level was markedly lower (51.1%). Indians had the highest satisfaction rate with their government response to the pandemic with a mean of 61%, compared with 43% in the UK, 37% in the USA, 38% in Italy and 23% in Spain.

Univariate analysis by HCP (N=2233)

Table 3 focuses on HCPs—66.3% consultants/attending physicians, 22.3% sonographers and 11.4% trainee/resident physicians (who are the youngest cohort overall). Of physicians and sonographers, 62.4%–63.3% and 54.3%–55.6%, respectively, reported changes to their duties and patient contact throughout the pandemic.

COVID-19 prevalence

Suspected or confirmed SARS-CoV-2 prevalence was similar across the groups (12.6% to 14.2%). 87.0% of trainees worked in high-risk areas, compared with 77.3% of consultants and 67.5% of sonographers. Trainees self-isolated for 1 day less on average (8.5 days) compared with consultants and sonographers (9.6 and 9.7 days, respectively).

PPE use and provision

The PPE reported in each HCP group as most frequently used when performing ultrasonography was gloves and a surgical mask (21.0%-30.3%), with 11.6%-15.0% reporting no PPE use. Sonographers saw more patients who did not wear a mask (33.3%) compared with trainees (7.9%) and consultants (13.9%).

A larger proportion of trainees (57.1%) interacted with patients with suspected or confirmed SARS-CoV-2 compared with consultants (40.6%) and sonographers (24.2%) but were less likely to use PPE for all patients (48.8%), compared with consultants (63.1%) and sonographers (66.9%).

Of the total trainees, 83.9% reported PPE concerns (compared with 73.1% of consultants and 71.9% of sonog-raphers), with 74.0% reusing or recycling PPE (compared with 59.9% consultants and 58.9% sonographers).

Anxiety, depression and support

Rates of anxiety (39.4%-47.7%) and depression (26.9%-31.0%) were similar across the HCP groups, with 18.3%-25.2% and 7.5%-9.2% of participants meeting the criteria for moderate to severe anxiety and depression, respectively. Those working in high-risk areas appear more inclined to complete the HADS (online supplement 10: Hospital Anxiety and Depression scale (HADS) breakdown by risk of working area (n = 1058)). However, rates of mild to severe anxiety are overall similar, with more depression reported by those working in lower-risk areas.

*Numbers of Hospital and Anxiety Depression Scale (HADS) respondents lower than the main survey (n, Consultants/attending=715; Sonographer=214; Trainees/residents=129).

HCP, healthcare professional; PCR, Polymerase Chain Reaction; PPE, personal protective equipment.

Trainees reported lower satisfaction/support from their local unit (58.3%, compared with 70.5% and 68.1% in consultants and sonographers, respectively) and government (44%, compared with 47% and 57% in consultants and sonographers, respectively).

Univariate analysis by PPE (N=2233)

Table 4 focuses on common combinations of PPE usedwhen performing an ultrasound scan.

COVID-19 prevalence

Of the total respondents, 2.2% reported using gloves in isolation. Twenty-nine per cent of this group reported suspected or confirmed COVID-19.

The most used combination of PPE when performing an ultrasound scan was gloves and a surgical mask (used by 22.3% of respondents). Of participants using this combination of PPE, 45.4% (226/497) reported interacting with patients with confirmed SARS-CoV-2, with 16.9% of this group reporting suspected or confirmed COVID-19.

The use of gloves with an FFP3/N95 mask instead of a surgical mask when performing ultrasound was reported by 4.3% (without visor) and 2.3% (with visor) of HCPs. Of those using gloves and FFP3/N95 mask, 10.5% reported suspected or confirmed COVID-19, compared with 3.9% of those who also used a visor.

Four per cent of all HCPs reported using 'full' PPE, 81.1% of whom worked in a COVID-19 high-risk setting. Full PPE advised for use by clinicians when interacting with a suspected or confirmed SARS-CoV-2 patient includes gloves, gown, N95/FFP3 mask, a surgical hat and visor. Of those using full PPE, 37.8% interacted at least once with patients with suspected or confirmed SARS-CoV-2. Of this group, 6.7% reported suspected or confirmed SARS-CoV-2.

Of the HCPs, 82.4% reported patients wearing a mask during clinical interactions. This was within a high-risk area of work in 76.5% cases.

Anxiety, depression and support

HCPs who reported PPE shortages had higher rates of anxiety (45.4%) and depression (31.5%) compared with those without shortages (29.6% and 18.5%, respectively) (online supplement 11: Comparison of Hospital Anxiety and Depression scale (HADS) scores in those with (n = 788) and without personal protective equipment (PPE) shortages (n = 270) (Total n = 1058)).

Lower satisfaction/support from their local unit ranged between 66% and 75% with a mean level of government satisfaction ranging between 40% and 68% between the PPE subgroups.

DISCUSSION Summary

We found that trainees and sonographers are generally more exposed to SARS-CoV-2, with sonographers seeing more patients who did not wear a mask and trainees working the most in higher risk areas. Trainees are thus

	None	Gloves only	Gloves+surgical mask	Gloves Gloves +surgicalmask+visor +FFP3 mask	Gloves r +FFP3 mask	Gloves +FFP3 mask+visor	Gloves +FFP3 mask +visor+gown +surgical hat

Open access

more likely to interact with patients with suspected or confirmed SARS-CoV-2 and have greater PPE concerns with poorer satisfaction and support. The most common PPE combination in use by HCPs were gloves and a surgical mask, with 18% of patients reporting not wearing a mask. Prevalence of SARS-CoV-2 was lower among HCPs when visors, filtering face masks or full PPE was used. Up to one in five respondents met the criteria for either moderate to severe anxiety or depression. Our findings suggest that suspected or confirmed SARS-CoV-2 prevalence among HCPs working with ultrasound in obstetrics and gynaecology was at least 13% at the time of the survey, with a higher prevalence in the UK.

Strengths

The main strengths of our study are the relatively large sample size, the assessment of HCP responses internationally and the ability to compare responses between different HCPs. We translated the survey into four languages to include as many potential participants as possible. Furthermore, the response rate of ISUOG members was greater than non-ISUOG members, as expected, given the target population. We compared responses between ISUOG and non-ISUOG members to ensure the data could be reliably grouped for the analysis.

Weaknesses

The key weakness of the study was the relatively low response rate and the method of sample selection that introduces possible selection bias when interpreting the results. As this is a descriptive study discussing early experience and well-being of HCPs working with ultrasound in obstetrics and gynaecology during the evolving pandemic, it is important not to draw conclusions about causation, one reason why univariate analyses were performed. For example, we cannot link use of PPE to levels of anxiety and depression in this study. We combined suspected and confirmed SARS-CoV-2, at the time of writing, as the majority of HCP did not have the same access to a swab or antibody test that is now available.

COVID-19 prevalence

Although international prevalence varies, at the time of writing, confirmed global SARS-CoV-2 cases had surpassed 90 million. The suspected or confirmed SARS-CoV-2 prevalence of 13% in this international study is consistent with other published reports on SARS-CoV-2 and HCP, where prevalence ranges from 1.6% to 22%.^{16–22} These studies have now been conducted across multiple specialities in many countries, with prevalence determined by PCR as well as antibody testing. One UK study within the field of obstetrics and gynaecology identified an HCP SARS-CoV-2 prevalence of 22%.¹⁸ Given that the advice for use of PPE is consistent within obstetrics and gynaecology,⁶ the higher prevalence may relate to respondents not using PPE or not using it correctly. The prevalence suggested by our dataset may be associated with PPE supply concerns, the need to recycle or reuse PPE, a lack

of guidance regarding when to use various levels of PPE, or due to many respondents experiencing high-risk interactions with patients, for example, scanning in proximity for prolonged periods of time.

PPE use and provision

Countries with greatest concern for PPE from our survey included Spain, Italy, the Philippines and the USA, with similarly high rates of PPE recycling. In the UK and India, over half of respondents expressed concern. The SARS-CoV-2 pandemic led to imposed export restrictions as domestic needs increased, demand shock, rush of PPE acquisition and supply chain failures with variation of national healthcare advice.^{23–26} As an example, China was responsible for mass production of clinical gowns, manufacturing 50% of the world's demand prepandemic.²³ This all contributed to the soaring global costs of PPE and the financial consequences of obtaining the necessary materials to safely support each healthcare system. In the USA, gowns were 7.5 times more expensive in 2020 compared with 2019.²⁴ Face masks were nine times more costly; N95 respirators were priced eight times the prepandemic rate; and gloves cost 2.5 times more.²⁴ PPE concern and recycling may have been a consequence of the logistical and financial complications seen as part of the SARS-CoV-2 response. However, as each healthcare system had varying prepandemic funding concerns and constraints, as well as varying HCP advice, these may have also compounded PPE supply and distribution further at a time of extreme need.

More trainee doctors reported working in higher-risk areas, as well as being more likely to interact with patients with suspected or confirmed SARS-CoV-2 than consultants or sonographers. They also had higher levels of concern regarding PPE, reusing and recycling more PPE, with a poorer perception of unit and governmental satisfaction and support. It is well documented that HCP burnout relates to anxiety and depression and that burnout is particularly prevalent among trainees.²⁷ Fears of infection and death during the pandemic may exacerbate this problem²⁸ and may also relate to inadequate support or protection.

Sonographers also reported seeing more patients who did not wear a mask. The survey shows a worrying pattern where HCPs with the least agency (trainees and sonographers) were not only more likely to see more high-risk patients but were less likely to be protected. It is perhaps not surprising they expressed greater concerns than other colleagues. PPE issues may relate to systematic financial healthcare consequences previously described but, in this instance, may also have local aetiology. Those with least agency also tend to have the least power to instigate change in their department. Concerns may never reach managers and administrators who also may not be clinically trained or orientated. Communication failure may have led to the PPE concerns expressed by HCPs.

Consensus statements and national and international guidance have been published on advised levels of PPE in

relation to SARS-CoV-2, with increasing requirements based on clinical risk. At the top end of the scale, disposable gloves, disposable fluid-repellent coverall/gown, filtering face piece respirator and eye/face protection should be used when performing aerosol-generating procedures on possible or confirmed cases of SARS-CoV-2.⁶ ^{29 30} Of the study participants, 22.3% reported using gloves and a surgical mask, the combination recommended by the ISUOG consensus statement for HCPs performing ultrasound scans.⁶ Others reported using various combinations of PPE, some of which is recommended for high-risk, aerosol-generating patient-HCP interactions. However, a proportion also reported not using PPE. This variation in PPE may be due to local policy, dependent on wards or clinical areas where HCP duties extend beyond ultrasound, or a result of the PPE supply issues described previously. The use of full PPE or the addition of eye/face protection and/or filtering face piece respirators to gloves is associated with lower reports of suspected or confirmed SARS-CoV-2 when compared with gloves and surgical mask alone. This corroborates literature findings.¹⁹²²

Anxiety and depression

In our study, just under half of the survey respondents completed the HADS questionnaire. This may have been due to a language barrier. However, there is also stigma related to HCPs seeking help and support, even though it is known HCPs experience high levels of psychological morbidity.^{31–34} This may have discouraged HCPs to provide information relating to anxiety and depression.

From those who completed the HADS, almost half the respondents reported some level of anxiety and depression, with 19.8% and 8.8% experiencing moderate-to-severe anxiety and depression, respectively. Greater proportions were among female participants, with more depression reported by those working in lower-risk areas. Again, this may relate to the stigma for HCPs reporting psychological morbidity and seeking support, but also may be explained by a completion bias, that is, those with psychological morbidity may be more inclined to complete the HADS to increase awareness of these issues.^{31–34}

Given the design of this study, we must be careful not to relate this to COVID-19 and be aware that there may be selection bias. There are aspects of the obstetrics and gynaecology environment which may encourage higher pre-existing levels of anxiety and depression among HCPs prior to the SARS-CoV-2 pandemic. The investigating traumatic work-related events in obstetrics and gynaecology (INDIGO) study reports two-thirds of obstetrics and gynaecology trainees and consultants in the UK have been personally traumatised by work-related events unrelated to SARS-CoV-2, with 31% of them affected by post-traumatic stress disorder symptoms.³⁵ Of the total paediatricians, 14.1% and 7.3% reported mild to severe anxiety and depression using HADS in a survey published prior to the pandemic,³⁶ a specialty that reflects similar intensity.

Our findings strongly support the need for reliable infrastructure that provide HCP counselling and psychological support without stigma in every medical and surgical specialty. In the UK, services such as NHS Practitioner Health and the British Medical Association offer confidential support and protect HCPs at the national level, while locally, seniors provide regular debriefing sessions. However, provision of local and global support is not consistent, and thus movement beyond a culture of HCP stigma is essential.³¹

CONCLUSION

This study provides insight into the experience and well-being of clinicians working in the field of ultrasound in obstetrics and gynaecology during the early phase of the SARS-CoV-2 pandemic. Although further work is required to unpick the associations of the pandemic, PPE availability, SARS-CoV-2 prevalence, and anxiety and depression, we hope our report highlights the importance of provision of PPE and the need for national and international consistencies in advice regarding PPE requirements, regulations and use. HCPs all take risk daily, particularly trainees and sonographers who are generally more exposed to SARS-CoV-2 and less unable to communicate their concerns and needs. As many patients may harbour infection with minimal or without symptoms, there is a real need to ensure HCPs are consistently and adequately supported.

- 17 Gynecology Oncology
- 18 Gynecology Ultrasound
- 19 Early pregnancy unit Ultrasound and assessment
- 20 Radiology Ultrasound
- 21 Radiology non-ultrasound
- 22 Obstetrics/Gynecology/Radiology From home
- 23
- 16. Do you interact with patients confirmed or suspected to have SARS-CoV-2? (pleasechoose one option)
- 26 Yes every day
- 27 Yes every week
- 28 Yes every so often
- 29 I don't know
- 30 Not yet
- 31 No
- 32 33

34

17. Have you been using personal protective equipment (PPE) since the SARS-CoV-2 outbreak? (please choose one option)

- 35 No
- 36 Not yet
- 37 Yes for aerosol generating procedures only
- 38 Yes for suspected/positive patients only
- 39 Yes for all patients
- 40
- 41 18. When you perform an ultrasound scan please state what PPE you use: (please tick
 42 all that apply)
- 43 None
- 44 Gloves
- 45 Surgical mask
- 46 N95/FFP3 mask
- 47 Gown

1	Visor
2	Surgical hat
3	
4	19. Have there been any concerns regarding PPE provision or shortages since the
5	SARS-CoV-2 outbreak? (note – Full PPE includes a N95/FFP3 mask, visor, surgical
6	hat, gown and gloves) (please tick all that apply)
7	No issues with provision
8	Yes – supply issues with gloves
9	Yes – supply issues with surgical masks
10	Yes – supply issues with N95/FFP3 masks
11	Yes – supply issues with gowns
12	Yes – supply issues with visors
13	Yes – supply issues with surgical hats
14	Yes – supply issues with providing patients with a surgical mask
15	
16	20. Have you been asked to re-use or recycle any PPE? (please tick all that apply
17	option)
18	No
19	Yes - Gloves
20	Yes - Surgical mask
21	Yes - N95/FFP3 mask
22	Yes - Gown
23	Yes - Visor
24	Yes - Surgical hat
25	
26	21. Do you ask patients to wear a surgical mask? (please choose one option)
27	Yes
28	No
29 20	
30	
31	SARS-CoV-2 diagnosis
32	
33	22. Have you had or do you have SARS-CoV-2 based on clinical symptoms and/or a
34 25	SARS-CoV-2 swab (PCR) diagnosis? (please choose one option) No – no test or symptoms suggestive of SARS-CoV-2
35 36	Yes – suspected based on symptoms but have not had PCR swab testing
30 37	Yes – suspected based on symptoms but have not had PCR swab testing
37	Yes – confirmed on PCR swab testing but have had no symptoms
38 39	Yes – suspected based on symptoms and confirmed on PCR swab testing
39 40	res – suspected based on symptoms and commed on PCK swab testing
40 41	23. With regards to having a SARS-CoV-2 swab test, please choose one option:
42	Not been offered
43	Offered as experiencing symptoms
44	Offered as in contact with confirmed or probable SARS-CoV-2 patients
45	Offered as living with someone who has probable or confirmed SARS-CoV-2
46	Not applicable
47	

1 24. What symptoms have you experienced or are you experiencing? (please tick all 2 that apply) 3 None 4 High fever 5 Persistent dry cough 6 Productive cough 7 Shortness of breath/Difficulty breathing 8 Fatigue 9 Headache 10 Loss of sense of smell and/or taste 11 Sore throat 12 Chest pain 13 Diarrhoea 14 Myalgia 15 Loss of appetite 16 Hoarse voice 17 Abdominal pain 18 19 Personal SARS-CoV-2 pathway 20 21 25. At what point were you offered a SARS-CoV-2 swab? (please state number of days 22 into your illness with day 1 being the day you started to have symptoms. If you 23 have not had symptoms - please choose 'not had symptoms'. If you were not 24 offered a test, please choose 'not offered a test') 25 Not had symptoms 26 Not offered a test 27 Not applicable 28 Numbers offered 29 30 26. How severe was/is your infection? (please choose one option) 31 Mild COVID-19 (T< 37.8 oC, tiredness, muscle aches, headache, no breathlessness, normal 32 appetite) 33 Moderate COVID-19 (T> 37.8 oC, troublesome cough, breathless on exercise, tired but no chest or abdominal pain) 34 35 Severe COVID-19 (T> 37.8 oC, noticeably breathless even when sitting still, unable to 36 complete sentences when talking, chest or abdominal pain, reduced appetite) 37 Critical COVID-19 (development of severe acute respiratory syndrome in need of ventilator 38 or other respiratory support) 39 Not applicable 40 41 27. How long were you or have you been symptomatic for? (please state number of 42 days. If you have not had symptoms – please choose 'not had symptoms') 43 Not had symptoms 44 Numbers offered 45

1	28. How long did you stay at home before going back to work, or if current infection,
2	how long have you been at home for? (please state number of days. If you have
3	not had symptoms – please choose 'not had symptoms')
4	Not had symptoms
5	Numbers offered
6	
7	29. Did you or do you feel under pressure from your employers to return to work
8	before making a full recovery? (please choose one option)
9	Yes

31 32	Hospital Anxiety and Depression Scale (HADS)
33	42. Choose the reply that is closest to how you have been feeling in the past week.
34	Don't take too long over your replies: your immediate is best.
35	bon t take too long over your replies. your ininediate is best.
36	I feel tense or 'wound up':
37	Most of the time
38	A lot of the time
39	From time to time, occasionally
40	Not at all
41	
42	43. Choose the reply that is closest to how you have been feeling in the past week.
42	Don't take too long over your replies: your immediate is best.
43 44	Don't take too long over your replies, your inimediate is Dest.
44 45	I still onion the things I used to onion
	I still enjoy the things I used to enjoy:
46	Definitely as much
47	Not quite as much

1	
1	Only a little
2	Hardly at all
3 4	44. Choose the reply that is closest to how you have been feeling in the past week.
4 5	Don't take too long over your replies: your immediate is best.
6	
7	I get a sort of frightened feeling as if something awful is about to happen:
8	Very definitely and quite badly
9	Yes, but not too badly
10	A little, but it doesn't worry me
11	Not at all
12	
13	45. Choose the reply that is closest to how you have been feeling in the past week.
14	Don't take too long over your replies: your immediate is best.
15	
16	I can laugh and see the funny side of things:
17	As much as I always could
18	Not quite so much now
19	Definitely not so much now
20	Not at all
21	
22	46. Choose the reply that is closest to how you have been feeling in the past week.
23	Don't take too long over your replies: your immediate is best.
24	
25	Worrying thoughts go through my mind:
26	A great deal of the time
27	A lot of the time
28	From time to time, but not too often
29	Only occasionally
30	
31	47. Choose the reply that is closest to how you have been feeling in the past week.
32	Don't take too long over your replies: your immediate is best.
33	
34	l feel cheerful:
35	Not at all
36	Not often
37	Sometimes
38	Most of the time
39	
40	48. Choose the reply that is closest to how you have been feeling in the past week.
41	Don't take too long over your replies: your immediate is best.
42	
43	I can sit at ease and feel relaxed:
44	Definitely
45	Usually
46	Not often
47	Not at all

1 2 3 4 5 6	49. Choose the reply that is closest to how you have been feeling in the past week. Don't take too long over your replies: your immediate is best. I feel as if I am slowed down: Nearly all the time
7	Very often
8	Sometimes
9 10	Not at all
10 11 12 13	50. Choose the reply that is closest to how you have been feeling in the past week. Don't take too long over your replies: your immediate is best.
14	I get a sort of frightened feeling like 'butterflies' in the stomach:
15	Not at all
16	Occasionally
17	Quite often
18	Very often
19 20 21 22	51. Choose the reply that is closest to how you have been feeling in the past week. Don't take too long over your replies: your immediate is best.
23	I have lost interest in my appearance:
24	Definitely
25	I don't take as much care as I should
26	I may not take quite as much care
27	I take just as much care as ever
28	
29 30 31	52. Choose the reply that is closest to how you have been feeling in the past week. Don't take too long over your replies: your immediate is best.
32	I feel restless as I have to be on the move:
33	Very much indeed
34	Quite a lot
35	Not very much
36	Not at all
37	
38	53. Choose the reply that is closest to how you have been feeling in the past week.
39 40	Don't take too long over your replies: your immediate is best.
40	Llook forward with an avmant to things
41 42	I look forward with enjoyment to things: As much as I ever did
42 43	Rather less than I used to
44	Definitely less than I used to
45	Hardly at all
46	
47	

1 54. Choose the reply that is closest to how you have been feeling in the past week.

- 2 Don't take too long over your replies: your immediate is best.
- 3
- 4 I get sudden feelings of panic:
- 5 Very often indeed
- 6 Quite often
- 7 Not very often
- 8 Not at all
- 9
- 10 55. Choose the reply that is closest to how you have been feeling in the past week.
- 11 Don't take too long over your replies: your immediate is best.
- 12
- 13 I can enjoy a good book or radio or TV program:
- 14 Often
- 15 Sometimes
- 16 Not often
- 17 Very seldom
- 18
- 19
- 56. Thank you for filling out this questionnaire. Please complete last question to end.

1	Supplement 2: Original study protocol
2	Title: An international survey of the impact of COVID19 on healthcare professionals carrying
3	out ultrasonography, service provision and mental state in Obstetrics and Gynecology
4	
5	Date: 19 th April 2020
6	
7	Main Sponsor: UZ Leuven Belgium
8	Carried out in collaboration with: International Society of Ultrasound in Obstetrics and
9	Gynecology (ISUOG)
10	Version number: 1
11	Principal Investigators: Professor Tom Bourne and Professor Dirk Timmerman
12	Co-Investigators: Dr Christopher Kyriacou, Dr Harsha Shah
12	
	Protocol to be assessed by: EC Onderzoek UZ Leuven, Belgium.
14	
15	Design: Prospective cohort observational survey study.
16	
17	Aim: To assess the services and psychological impact of the COVID-19 pandemic to
18	healthcare professionals carrying out ultrasonography within the Obstetrics and Gynecology
19	specialty.
20	
21	Hypothesis:
22	1. Service provision to support healthcare professionals during the COVID-19 pandemic
23	varies considerably in every unit globally;
24	Healthcare professionals will have experienced COVID-19 first-hand;
25	3. The COVID-19 pandemic has caused significant psychological distress to healthcare
26	professionals which can be assessed using a validated psychological tool.
27	
28	Outcome measures:
29	1. A questionnaire to healthcare professionals detailing medical history, role, area of
30	work, personal protective equipment (PPE), COVID-19 patient contact and personal
31	COVID-19 experience will allow data to be collected in relation to the physical impact
32	of the COVID-19 pandemic;
33	2. Use of the validated Hospital Anxiety and Depression Scale (HADS) will allow
34	psychological morbidity of healthcare professionals to be assessed.
35	
36	Eligibility: Members of ISUOG that fill in the questions via an online survey platform. The
37	questionnaire will in English, Spanish, Greek, Hindu, Mandarin and Cantonese.
38	
39	Duration: The survey will be conducted over a period of two weeks in order to allow time
40	for the questions to be answered, two reminder emails will be sent – one at a week before
40	closure and one 24 hours before closure
41	
	Concent: Concent will be implied when the question naive is filled in and there will be a
43	Consent: Consent will be implied when the questionnaire is filled in and there will be a
44 45	specific question asking for consent to take part in the survey, however all information is
45	anonymized and cannot be traced to an individual. No data will be requested that is in
46	breach of General Data Protection Regulation (GDPR).
47	

1 Background: The current coronavirus (SARS-CoV-2) pandemic carries a number of new 2 challenges to local, national and international healthcare agencies in order to protect 3 patients and healthcare professionals (physicians, sonographers, allied healthcare 4 professionals). Guidance varies from nation to nation with issues arising from redeployment 5 of clinicians, prioritization of particular services and provision of PPE. This is important as 6 those carrying out ultrasound scans are in close proximity to patients and are at high risk of 7 SARS-CoV-2 infection¹. 8 Anxiety and depression are recognized complications for healthcare professionals working 9 in a high-stress environment, particularly one that now encompasses a novel disease for 10 which we have yet to fully understand². 11 12 Methods: This is a prospective cohort study and will recruit via the dissemination of a 13 survey online through the ISUOG mailing list. Consent will be presumed when the form is 14 filled in and submitted. This will allow healthcare professionals globally to answer. The 15 questionnaire has been devised to assess the service provision in units around the world as 16 well as question personal COVID-19 experience. Following on from this will be an optional 17 HADS. The HADS is a 14-part questionnaire with 7 questions exploring symptoms of anxiety 18 and depression, respectively. Each question is answered with a scale of 0-3 to represent 19 severity of symptoms, with an independent maximum score of 21 for depression and 20 anxiety. A score ≥ 11 is deemed moderate, whilst ≥ 16 represents severe symptoms³. 21 22 Statistics and data analysis: Sample size will be dependent on the number of online 23 responders. We hope that there will be significant uptake from a number of countries 24 globally. The recruitment will be online so no breach to social distancing rules will apply. To 25 compare differences in binary variables we will use the likelihood ratio, chi-squared or 26 Fisher's exact test and will consider a p value <0.05 as statistically significant. Ninety-five per 27 cent confidence intervals for rates of psychological morbidity will be created using the 28 Wilson method. 29 30 Dissemination: Following the collection and analysis of the data obtained from the 31 questionnaire, we aim to present the findings to the ISUOG membership and publish in 32 peer-reviewed journals – preferably Ultrasound in Obstetrics and Gynecology. The need to 33 understand the experience of the pandemic by frontline workers is extremely important, 34 not only to support them now, but to prepare for any future international healthcare 35 emergency. 36 37 References 38 1. When health professionals look death in the eye: the mental health of professionals
 who deal daily with the 2019 coronavirus outbreak. *Psychiatry Res.* 2020 April
 13;288:112972. doi:10.1016/j.psychres.2020.112972.
 Zigmond AS, Snaith RP. The hospital anxiety and depression scale. Acta psychiatrica
 scandinavica. 1983 Jun;67(6):361-70.

1 Supplement 3: Breakdown of healthcare professional (HCP) roles for analysis.

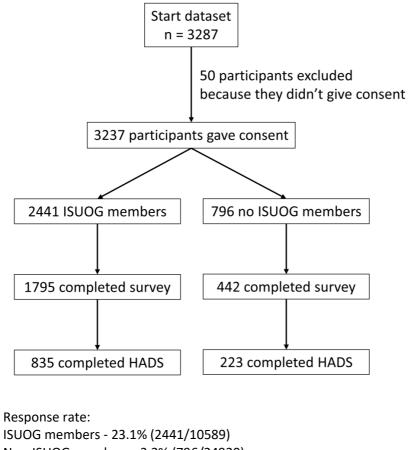

Job title	
Doctor in research – Gynecology	Split up based on age: trainees/residents and consultants/attending
Doctor in research – Obstetrics	Split up based on age: trainees/residents and consultants/attending
Doctor in research – Obstetrics and Gynecology	Split up based on age: trainees/residents and consultants/attending
Doctor in research – Radiology/Sonologist	Split up based on age: trainees/residents and consultants/attending
Doctor in training – Gynecology	Split up based on age: trainees/residents and consultants/attending
Doctor in training – Obstetrics	Split up based on age: trainees/residents and consultants/attending
Doctor in training – Obstetrics and Gynecology	Split up based on age: trainees/residents and consultants/attending
Doctor in training – Radiologist/Sonologist	Split up based on age: trainees/residents and consultants/attending
Gynecologist	Split up based on age: trainees/residents and consultants/attending
Midwife – Early pregnancy only	Sonographer
Midwife – Obstetrics	Sonographer
Nurse – Early pregnancy only	Sonographer
Nurse – Gynecology	Sonographer
Nurse – Obstetrics	Sonographer
Nurse – Obstetrics and Gynecology	Sonographer
Obstetrician	Split up based on age: trainees/residents and consultants/attending
Obstetrician and Gynecologist	Split up based on age: trainees/residents and consultants/attending
Radiologist/Sonologist	Split up based on age: trainees/residents and consultants/attending
Retired	Exclude from analyses
Sonographer – Gynecology	Sonographer
Sonographer – Obstetrics	Sonographer
Sonographer – Obstetrics and Gynecology	Sonographer

1 Supplement 4: Breakdown of risk by area of work for analysis.

Areas of work	Risk of COVID-19 infection		
Early pregnancy unit - Ultrasound and assessment	High risk		
Gynecology - Acute Gynecology	High risk		
Gynecology - Benign Gynecology	Low risk		
Gynecology – Oncology	Low risk		
Gynecology - Ultrasound	High risk		
Obstetrics/Gynecology/Radiology - From home	Low risk		
Obstetrics - Antenatal clinic	Moderate risk		
Obstetrics - Antenatal ward	Moderate risk		
Obstetrics - Birth center/Birthing center	High risk		
Obstetrics - Community clinics	Moderate risk		
Obstetrics - Labor ward	High risk		
Obstetrics - Maternity helplines	Low risk		
Obstetrics - Maternity triage/Hospital obstetric triage	High risk		
Obstetrics - Postnatal ward	Moderate risk		
Obstetrics – Ultrasound	High risk		
Radiology - non-Ultrasound	Moderate risk		
Radiology - Ultrasound	High risk		

2

- 1 Supplement 5: Flowchart summarizing survey participants, differentiating International
- 2 Society of Ultrasound in Obstetrics and Gynecology (ISUOG) members and non-ISUOG
- 3 members (n = 3287).

- 8 Non-ISUOG members 3.2% (796/24920).
- 9 Abbreviations: HADS (Hospital Anxiety and Depression scale)
- 10

4 5 6

7

1 Supplement 6: Demographics of survey participation, differentiated based on

2 International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) membership (n

3 **= 3237).**

	ISUOG members (n = 2441)	Others (n = 796)
Total ISUOG mailing list (n)	10589	24920
Response of total ISUOG mailing list (n, %)	2441 (23%)	796 (3%)
Countries (n)	120	78
Number of respondents in English (n)	1603	357
Number of respondents in Spanish (n)	564	317
Number of respondents in Italian (n)	195	72
Number of respondents in French (n)	79	50
Completed survey	1795	442
Countries (n)	110	65
Age (mean, range)	47.2 (18-82)	47.7 (25-78)
≤20 years	1 (0%)	0 (0%)
21-30 years	95 (5%)	22 (5%)
31-40 years	454 (25%)	104 (24%)
41-50 years	549 (31%)	137 (31%)
51-60 years	475 (26%)	121 (28%)
61-70 years	201 (11%)	50 (11%)
>70 years	18 (1%)	6 (1%)
Gender (n, %)		
Female	1176 (66%)	298 (68%)
Male	613 (34%)	142 (32%)
Intersex	1 (0%)	0 (0%)
Prefer not to say	3 (0%)	0 (0%)
Prevalence suspected or confirmed SARS-CoV-2 based on symptoms +/- PCR testing (%)	230 (13%)	60 (14%)
Is PPE used by res	pondents (n, %)	
Not yet	217 (12%)	62 (14%)
Yes - for aerosol generating procedures only	110 (6%)	23 (5%)
Yes - for all patients	1142 (64%)	250 (57%)
Yes - for suspected/positive patients only	324 (18%)	105 (24%)
What PPE is used by	respondents (n, %)	
None	59 (3%)	17 (4%)
Gloves only	38 (2%)	11 (3%)
Gloves + surgical mask	393 (22%)	104 (24%)
Gloves + surgical mask + visor	116 (6%)	36 (8%)
Gloves + FFP3 mask	83 (5%)	12 (3%)
Gloves + FFP3 mask + visor	39 (2%)	12 (3%)
Gloves + FFP3 mask + visor + gown + surgical hat	70 (4%)	20 (5%)

Patient wearing mask	1482 (83%)	359 (82%)			
5		559 (82%)			
Concerns regarding a lack of PPE (n, %)					
No	475 (26%)	104 (24%)			
Gloves	223 (12%)	55 (13%)			
Gown	499 (28%)	130 (30%)			
N95/FFP3 mask	1014 (57%)	265 (60%)			
Surgical hat	187 (10%)	46 (10%)			
Surgical mask	657 (37%)	163 (37%)			
Visor	458 (26%)	124 (28%)			
Surgical mask (patient)	479 (27%)	130 (30%)			
Type of PPE that	has been re-used or recycled (n, %)				
No	690 (38%)	175 (40%)			
Gloves	27 (2%)	7 (2%)			
Gown	229 (13%)	58 (13%)			
N95/FFP3 mask	722 (40%)	164 (37%)			
Surgical hat	74 (4%)	18 (4%)			
Surgical mask	435 (24%)	130 (30%)			
Visor	493 (27%)	128 (29%)			
Anxiety (mean, 95% CI)*	7 (6.7-7.3)	6.6 (6.1-7.1)			
0-7 (none)	480 (57%)	140 (63%)			
8-10 (mild)	180 (22%)	49 (22%)			
11-21 (moderate to severe)	175 (21%)	34 (15%)			
Depression (mean, 95% CI)*	5.4 (5.2-5.7)	4.9 (4.4-5.4)			
0-7 (none)	587 (70%)	173 (78%)			
8-10 (mild)	171 (20%)	34 (15%)			
11-21 (moderate to severe)	77 (9%)	16 (7%)			

1 *Numbers of HADS respondents lower than for main survey (n = 835 ISUOG members, n = 223 Others)

2 Abbreviations: PCR (Polymerase Chain Reaction); PPE (Personal Protective Equipment)

1 Supplement 7: Comparison of comorbidity in those with (n = 290) and without suspected 2 or confirmed SARS-CoV-2 (n = 1947) (Total n = 2237).

	Suspected or confirmed SARS- CoV-2	Without suspected or confirmed SARS-CoV-2
Heart disease (n, %)	3 (1%)	43 (2%)
Lung disease (n %)	30 (10%)	160 (8%)
Use of antihypertensives (n, %)	39 (13%)	283 (15%)
Smokers (n, %)	13 (4%)	125 (6%)

1 Supplement 8: Comparison of Hospital Anxiety and Depression scale (HADS) scores in

2 those with (n = 162) and without suspected or confirmed SARS-CoV-2 (n = 896) (Total n =

3 **1058).**

	Suspected or confirmed SARS- CoV-2	Without suspected or confirmed SARS-CoV-2
Anxiety (mean, 95% Cl)	7.4 (6.7-8.0)	6.8 (6.6-7.1)
0-7 (none)	86 (53%)	534 (60%)
8-10 (mild)	32 (20%)	197 (22%)
11-21 (moderate to severe)	44 (27%)	165 (18%)
Depression (mean, 95% CI)	5.8 (5.2-6.4)	5.2 (5.0-5.5)
0-7 (none)	105 (65%)	655 (73%)
8-10 (mild)	37 (23%)	168 (19%)
11-21 (moderate to severe)	20 (12%)	73 (8%)

4

1 Supplement 9: Hospital Anxiety and Depression scale (HADS) breakdown by gender (n =

2 **1058).**

	Female	Male	Prefer not to say
Number of respondents (n, %)	754 (71%)	303 (29%)	1 (0%)
Anxiety (mean, 95% CI)*	6.9 (6.6-7.2)	5.7 (5.3-6.2)	-
0-7 (None) (n, %)	450 (60%)	202 (67%)	1 (100%)
8-10 (Mild) (n, %)	148 (20%)	60 (20%)	0 (0%)
11-21 (Moderate to severe) (n, %)	156 (21%)	41 (14%)	0 (0%)
Depression (mean, 95% CI)*	5.4 (5.2-5.7)	5.0 (4.6-5.4)	-
0-7 (none) (n, %)	529 (70%)	230 (76%)	1 (100%)
8-10 (mild) (n, %)	146 (19%)	59 (19%)	0 (0%)
11-21 (moderate to severe) (n, %)	79 (10%)	14 (5%)	0 (0%)

1 Supplement 10: Hospital Anxiety and Depression scale (HADS) breakdown by risk of 2 working area (n = 1058).

	Low risk	Moderate risk	High risk
Number of respondents (n, %)	23 (2%)	28 (3%)	1007 (95%)
Anxiety (mean, 95% CI)*	8.3 (6.3-10.3)	5.1 (3.6-6.6)	6.6 (6.3-6.8)
0-7 (None) (n, %)	13 (57%)	21 (75%)	619 (61%)
8-10 (Mild) (n, %)	3 (13%)	3 (11%)	202 (20%)
11-21 (Moderate to severe) (n, %)	7 (30%)	4 (14%)	186 (18%)
Depression (mean, 95% CI)*	8.2 (6.0-10.3)	4.3 (2.7-5.8)	5.3 (5.0-5.5)
0-7 (none) (n, %)	12 (52%)	19 (68%)	729 (72%)
8-10 (mild) (n, %)	4 (17%)	6 (21%)	195 (19%)
11-21 (moderate to severe) (n, %)	7 (30%)	3 (11%)	83 (8%)

1 Supplement 11: Comparison of Hospital Anxiety and Depression scale (HADS) scores in

2 those with (n = 788) and without personal protective equipment (PPE) shortages (n = 270)

3 (Total n = 1058).

	PPE shortages	No PPE shortages
Anxiety (mean, 95% CI)	7.4 (7.1-7.7)	5.5 (5.0-6.0)
0-7 (none)	430 (55%)	190 (70%)
8-10 (mild)	183 (23%)	46 (17%)
11-21 (moderate to severe)	175 (22%)	34 (13%)
Depression (mean, 95% CI)	5.7 (5.5-6.0)	4.1 (3.7-4.5)
0-7 (none)	540 (69%)	220 (81%)
8-10 (mild)	167 (21%)	38 (14%)
11-21 (moderate to severe)	81 (10%)	12 (4%)
