**Key words:** alcohol, complex system, intervention, local policy, qualitative

**Word count:** 4,475

**ABSTRACT**

**Objectives:** Increasingly English local authorities have implemented an intervention called 'Reducing the Strength' (RtS) whereby off-licences voluntarily stop selling inexpensive 'super-strength' ( $\geq 6.5\%$  ABV) beers and ciders. We conceptualised RtS as an event within a complex system in order to identify pathways by which the intervention may lead to intended and unintended consequences.

**Design:** A qualitative study including a focus group and semi-structured interviews.

**Setting:** An inner-London local authority characterised by a high degree of residential mobility, high levels of social inequality and a large homeless population. Intervention piloted in three areas known for street drinking with a high alcohol outlet density.

**Participants:** Alcohol service professionals, homeless hostel employees, street-outreach managers and homeless alcohol consumers (n=30).

**Results:** Participants describe adaptive and maladaptive responses to the intervention potentially impacting on individual health and intervention compliance. Responses include consuming different drinks, finding alternative shops, using drugs or committing crimes to purchase more expensive drinks. Service providers suggested the current iteration of the intervention misses opportunities to encourage engagement between the council, alcohol services, homeless hostels and off-licence stores. Some participants believed small-scale interventions such as RtS may contribute to long-term political and cultural changes leading to more effective interventions.

**Conclusions:** RtS may have limited individual-level health impacts if the target populations remain willing and able to consume alternative means of intoxication as a substitute for super-strength products. RtS may provide opportunities for more joined up alcohol services and an impetus for future policies to reduce alcohol consumption.

**Strengths and limitations of this study:**

- A qualitative study of an innovative alcohol availability intervention from the perspectives of the target population and service providers for that population.
- This study utilises a unique perspective by drawing on complexity theory to develop multi-level theories of change.
- Our methods lead to a pluralistic account of how the alcohol availability intervention may impact multiple outcomes and contexts.
- The study was conducted in a single English local authority.
- The sample of homeless people is relatively small but includes some of the most vulnerable and hard-to-reach community members.

## INTRODUCTION

Alcohol is a global health concern, a causal factor in over 200 diseases and conditions (1) and contributes to healthcare costs,(2) crime and disorder and losses of workplace productivity.(3) Interventions that restrict the economic or physical availability of alcohol have been recommended to reduce alcohol-related harms.(4-7) There is a pattern of research from different national settings supporting the case for national and mandatory interventions that restrict alcohol availability.(5) Nonetheless, alcohol availability interventions are frequently delivered on a local and/or voluntary basis.(5, 8) Reviews of alcohol availability interventions and health have found that the evidence base relating to local and voluntary initiatives is inconsistent and underdeveloped.(5) This may be symptomatic of a broader perceived shortage of evidence to support public health decision-making relevant to local government and multi-sectorial initiatives.(9)

One recent UK alcohol intervention that embodies both localist and voluntary characteristics is called 'Reducing the Strength' (RtS). With the encouragement of local authorities, shops licensed to sell alcohol for off-premise consumption ('off-licenses') voluntarily stop selling inexpensive high strength ( $\geq 6.5\%$  ABV) beers and ciders, including products marketed as 'super-strengths' or 'white ciders'. These products and their marketing have been said to encourage excessive drinking and harmful behaviours amongst vulnerable sub-populations.(10, 11) A single 500ml can of super-strength can exceed the UK health guidelines for daily alcohol consumption, whilst a single 3 litre bottle can exceed the weekly guidelines.(12) Guidance for implementing RtS identifies street and homeless drinkers as target populations (13) based on assumptions about their consumption of these low-cost products, their vulnerability to alcohol addiction and perceived social problems around street drinking.(10, 14) RtS was first launched in Ipswich in 2012, and by early 2015 had been implemented in approximately eighty local authorities across England,(15) with some variation between areas with regards to the super-strength products targeted and linkages with services for the targeted populations.(13)

Availability modifications, such as RtS, are typically population-level interventions designed to encourage or compel changes in alcohol purchasing, consumption and health impacts.(4) In the case of RtS, both the physical and economic availability may be affected by the removal of cheap strong drinks from shops within a specific location. Even though the intervention itself may represent a relatively simple change to the local alcohol environment, the response of target populations and other agents within that environment is potentially complex.

Rickles, Hawe and others (16, 17) have argued that neighbourhood and community interventions can often be considered 'events' in complex systems that may trigger chains of responses and relational changes between individuals or groups.(16, 18) The complex system perspective argues that the most significant aspect of complexity lies not in the intervention itself, but in the system into which the intervention is introduced.(19) Evaluating the impact of events within the system may involve monitoring how different agents within the system respond, considering both intended and unintended consequences, and understanding how responses can potentially dampen or amplify the capacity of the intervention to contribute to system changes.(20, 21) In this paper, we have conceptualised RtS as an event in a complex system.

This study uses a systems perspective to explore how RtS was perceived and experienced by the target population of homeless drinkers and by service providers who work closely with this population. The aim is not to measure effects but rather to illustrate how a systems approach to qualitative research can provide local decision-makers with evidence that takes into account multiple pathways to impacts across different levels within a system. In this paper we focus on the levels of the individual, local environment, service provision and policy (see Figure 1).

## METHODS

This study is part of a wider programme of research co-produced with local authority practitioners. Further publications will include qualitative and quantitative findings relating to impacts on retailers and alcohol sales. The current study investigates the intervention from the perspective of a key target population, homeless people, and service providers who work closely with that population. The research was conducted in mid-2014 after the intervention was implemented in late 2013. The study involved a focus group and interviews with alcohol service professionals, workers at homeless hostels, street-outreach managers and homeless alcohol consumers (n=30). Ethical approval was obtained from the London School of Hygiene & Tropical Medicine Ethics Committee. All participants were allocated a pseudonym.

Qualitative methods were considered appropriate for identifying a wide range of potentially relevant issues.<sup>(22)</sup> Evaluators have argued that qualitative research is particularly well suited to capturing the complexity of interventions.<sup>(23, 24)</sup> This complexity may include multiple and unanticipated outcomes over variable time frames, competing aims and values of stakeholders and target populations and non-linear relationships between contexts, processes and outcomes.<sup>(16)</sup> Qualitative approaches that do not explicitly incorporate a systems lens may still include some or all of these features, but a systems approach encourages a framework for analysis that explicitly focuses on changes to behaviours and relationships between agents at multiple levels in response to an intervention.<sup>(16, 21)</sup> The flexibility of qualitative methodologies can also help researchers overcome some of the barriers to evaluating local health policy innovation, which can include small delivery scales, rapid delivery timescales <sup>(25)</sup> and a demand from local decision-makers for evidence that is sufficiently contextually rich to be recognisable to them as 'local'.<sup>(9, 26)</sup>

### Intervention and setting

The study focused on an inner-London borough characterised by high population density, social inequality and a high degree of residential mobility. In late 2013, off-licence shops in three 'hot spots' for street drinking were asked to voluntarily stop selling super-strength products. These areas have a very high alcohol outlet density and alcohol retailers primarily consist of small, independent 'newsagent' stores who open late and rely on alcohol as a large proportion of their total revenue. The RtS intervention was planned and implemented by the borough's council and police licensing teams and supported by community safety officers. The intervention has five stated aims, which are presented in Table 1.

**Table 1: RtS aims in one English local authority**

- |   |
|---|
| <ol style="list-style-type: none"><li>1. To remove 'super-strength' from off-licences;</li><li>2. Voluntary variation of existing licences to include a condition not to sell 'super-strength';</li><li>3. To reduce crime and anti-social behaviour (specifically street drinking and begging);</li><li>4. To reduce alcohol-specific admissions including repeat admissions;</li><li>5. To highlight the dangers of alcohol, particularly super-strength alcohol, to residents.</li></ol> |
|---|

Prior to the intervention 40% of the 78 off-licenses in the RtS area sold super-strength products. Following the intervention launch event, implementers reported that all but two off-licences agreed to participate in the scheme. At six months follow-up, implementers reported around 90% of off-licences continued to participate, and considered this a substantial reduction in super-strength availability for those areas.

### Recruitment and data collection

Homeless people are recognised as vulnerable and hard-to-reach groups, raising ethical and practical issues affecting recruitment and data collection. Service providers were interviewed to draw from their knowledge of homeless drinking behaviours but also to allow identification of contrasting

perspectives. Participants were recruited through stakeholder contacts and direct approaches to hostels and services. Homeless participants received information about the study from service providers with an invitation, but no obligation to take part. The mediating role of the service providers meant we were unable to track participants (homeless or otherwise) that were informed of the study but declined to take part. All recruitment was based on voluntary informed consent.

Most of the fieldwork involved semi-structured individual interviews. Some alcohol service professionals requested a focus group for logistical and time-management reasons. Service provider topic guides included sections on alcohol and homeless service provision, homeless peoples' drinking behaviours and the RtS intervention. Drinker topic guides covered similar themes but focused more on the participants' own behaviours and experiences. We asked specifically about super-strength consumption, but also more generally about how drinkers would respond to restricted alcohol availability. Interviews were conducted in work settings or hostels, audio-recorded and transcribed. Homeless participants received a £10 voucher as compensation for their time.

### Analysis

The first author coded the transcripts in NVivo 10 using the interview guide to group major themes; a second researcher double-checked the coding. We then utilised concepts from complexity theory to deductively code the transcripts. Specifically, we have used participant narratives to identify theories of change – including participants' views on what constitutes potential intended and unintended consequences that could follow from the implementation of RtS.

### RESULTS

Thirty people participated in the study (Table 2). The nine alcohol-consuming hostel residents were predominantly male and seven had been in the hostel system for over a year. Six reported previous experience of rough sleeping. Four stated that they were regular (daily) consumers of super-strengths whilst others consumed it less frequently, preferring alternatives such as wine, vodka, or regular beer and cider. Twenty-one service professionals participated in the study, eleven in a focus group at an alcohol service centre and ten individual semi-structured interviews were conducted with professionals in other services.

**Table 2: Number of participants**

	Individual interview	Focus group	Males	Females
<b>Participants</b>				
Homeless drinkers	9	0	8	1
Alcohol service managers and staff	2	11	4	9
Hostel managers and staff	6	0	2	4
Street-based services manager	2	0	2	0

Utilising participant narratives, we structured our analysis to consider different levels or domains at which the intervention constitutes an 'event' and where participants saw potential impacts stemming from the implementation of RtS. This includes the levels of the individual, local environment, services and policy, although we recognise that these levels are not mutually exclusive. Our findings are described below and depicted in Figure 1.

**FIGURE 1 ABOUT HERE****Findings at the individual level**

Homeless and service providers presented a range of opinions about which groups they thought the intervention targeted, which included but was not limited to street drinkers, rough sleepers and hostel residents. More broadly, participants tended to assume that super-strength products were consumed by disadvantaged, middle-aged males with high levels of alcohol dependency described by various service providers as “*problematic*”, “*physically dependent*” or “*hardcore entrenched*” drinkers.

Drinkers, and some service providers, had noticed the reduction of super-strength availability within the intervention areas and explained that only a limited number of shops continued to sell the products:

*I don't know if you're aware of that as well, but you know the strong lagers, i.e. the Special Brew and the Skol Super Light, all the 24 hours shops around here, all the police have completely stopped them from selling it, you can't buy any strong beers anywhere around here anymore. You know, except for a very select couple.*  
[Christopher, Drinker]

*now the Reduce the Strength campaign is in effect so a lot of these are no longer selling those brands that I just mentioned. However, there are still one or two doing it.* [Luke, Street-outreach manager]

Participants discussed this substantial, but not absolute, restriction in super-strength availability as an event that could lead to a number of substitution responses. Drinkers described still being able to purchase super-strengths by switching from compliant to non-compliant shops:

*That's what everyone does at the minute, they walk out further afield to get it...they go into the shops that still do sell it, which is only like a handful, not even a handful, a couple of them.* [Timothy, Drinker]

Drinkers disagreed about whether the necessity of walking longer distances would affect their purchasing behaviour. One said “*I'll walk as far as I can to get my same beer,*” [Max, Drinker] whereas others suggested there was a limit to the distance they would walk and this might vary depending on time of day. Service providers also reported seeing homeless and street drinkers, and alcohol-service clients still consuming super-strength products.

Participants also considered substituting drinks within compliant shops. Without prompting, several drinkers attempted to calculate the ways they could continue to consume the same number of units of alcohol from compliant stores. Some suggested they would switch to drinks with higher alcohol contents, such as wine, sherry or vodka. Other drinkers and service providers, however, questioned whether many homeless drinkers would be able to budget for the higher cost of a larger bottle of spirits (which were assumed to represent better value than smaller bottles) or make a bottle last longer than a day. Another form of substitution suggested was purchasing greater quantities of cheaper, weaker beer or cider. However, drinkers largely rejected this idea as they perceived such drinks to be insufficiently strong to achieve a feeling of intoxication, or prevent withdrawal symptoms. One drinker called ‘normal’ strength beers “*a waste of time*” [Christopher] and another described them as “*piss water*” [Joshua].

Several drinkers and service providers also suggested that more drinkers would engage in alternative substance abuse, as many had histories of co-dependency. This could include illegal drugs or products not intended for consumption such as cleaning products or solvents:

*So I have one beer or one [butane] gas, but what I worry about there is once I've finished that beer, then I've probably by that time nearly gone through half of that one gas...When I really am getting anxiety attacks from the alcohol comedown and all that kind of stuff, the gas really douses it, you know? [Christopher, Drinker]*

*I think the people who need alcohol and haven't got any money...can do extreme things [such as] drink a hand sanitizer in hospitals...I think it's a least bad thing if people can drink something that's at least commercially produced and safe. [Lauren, Alcohol service professional]*

### Findings at the local environment level

#### *Societal impacts*

RtS also aims to address wider societal harms, such as crime, anti-social behaviour and public intoxication, which have consequences beyond the health of individual drinkers. Participants reported not seeing any wider societal impacts at this stage of the intervention. However, some speculated that if super-strengths were to be entirely removed from the local market, there could be short-term unintended consequences on the local community should drinkers turn to crime or begging to obtain more expensive products:

*they'll try and blag or steal, or whatever it takes, you know to get it, as I said, it won't make much difference. [Kevin, Drinker]*

*I think the other thing that would happen is that you could see offending go up. [Lauren, Alcohol service professional]*

*If the money's not there they might turn to committing crime. [William, Alcohol service manager]*

On the other hand, a hostel employee argued that any potential spike in more visible or risky forms of crime would only be short lived:

*In terms of sustainability it probably depends on the risk associated with whatever they're doing. So things like pickpocketing is quite high risk because you're quite likely to attract the attention of the police and so that's probably not sustainable. [Peter, Hostel staff]*

#### *The retail environment*

The retail sector are integral to the intervention's feasibility and service providers and drinkers alike described the complex, often reciprocal relationships between drinkers and shops; for example, participants reported that shopkeepers sometimes give regular drinkers informal credit or special offers. The voluntary nature of the intervention and the willingness of customers to switch to non-compliant shops was assumed to result in participating stores being economically disadvantaged:

*I was in this shop once a few weeks ago and one of the council people were in the shop at the same time as I was there. And he was going, right, you're not allowed to*

1  
2  
3 *sell this Polish lager anymore because it was strong or something and you're not*  
4 *allowed to sell this one and that one and he was pointing. They should be allowed to*  
5 *sell it...the shopkeeper's going to lose a fortune taking all them off the shelf.*  
6 [Timothy, Drinker]  
7

8  
9 *And say what incentives could be offered to encourage businesses to sign up because*  
10 *especially, well, for the off-licences down our road high strength alcohol would be a*  
11 *large volume of their trade...that would have a huge impact I imagine.* [Peter, Hostel  
12 staff]  
13

14 The quotes above illustrate how drinkers conveyed sympathy towards small business shop  
15 keepers, whilst the service provider frames the potential for lost profits as a disincentive for  
16 intervention take-up. This latter perspective was linked to the view that greater incentives  
17 for shops to take part could increase participation, which could in-turn reduce opportunities  
18 for individuals to substitute shops.  
19

20 On the other hand, some participants also considered how RtS may actually benefit shops if drinkers  
21 continue to frequent their current stores and switch to more expensive products. As a result, more  
22 shops may be willing to engage with the intervention. For example, Christopher described how  
23 drinkers may begin purchasing vodka at compliant stores, which tends to cost more per unit of  
24 alcohol than super-strength beers or ciders:  
25

26  
27 *You can't buy any strong beers anywhere around here anymore, except for a very*  
28 *select couple, but it hasn't deterred anyone though has it? Christ, yeah, cos they've*  
29 *still got bottles of vodka in there.* [Christopher, Drinker]  
30  
31

### 32 **Findings at the services level**

33 Within the complex system in which RtS is implemented, there are also consequences for service  
34 provision. The integration of RtS with existing homeless or alcohol services was a particular concern  
35 of service providers who largely saw the intervention as too limited to effectively address excessive  
36 alcohol consumption. Several participants emphasised the need for a holistic approach to treatment  
37 services that address the underlying causes for addiction, such as poverty, homelessness,  
38 relationship breakdown and bereavement:  
39

40  
41 *I don't think [RtS] acknowledges the psychological reasons why people drink, I don't*  
42 *think it acknowledges all the kind of needs that are being met, albeit in a*  
43 *maladaptive way by alcohol.* [Adam, Hostel manager]  
44

45 Service providers who were sceptical about the potential benefit of RtS did note that it might be  
46 used as a tool to engage drinkers who were already seeking help. For example, the intervention  
47 could be used to help talk to their drinkers reducing alcohol consumption in conjunction with  
48 support plans:  
49

50  
51 *it helps us because you could in your harm minimisation support plans say drink at*  
52 *different times, drink a lower strength beer, drink less amount and only go to that*  
53 *shop....if you know they're not selling strong drinks you can make it all part of the*  
54 *task-oriented support plan* [Thomas, Hostel manager]  
55

56 Service providers tended to agree that in this particular roll-out of RtS, there was a missed  
57 opportunity to align more closely with the business sector. Some of these service providers had not  
58 heard of RtS and felt that explicit links between different stakeholders could have initiated positive  
59  
60

changes. If implemented to encourage service linkage, RtS was seen as an opportunity to work more closely with local shop managers to assist dependent drinkers through alcohol supply regulation:

*I can't understand why we [the alcohol service] weren't asked to participate because we have a lot of volunteers and services that would have been able to contribute by going around to some of the shops as well because I think it's been about trying to get the shop owners to take responsibility for the community. [Eleanor, Alcohol service professional]*

### Findings at the policy level

#### *Making alcohol the new tobacco*

At a policy level, service providers contextualised the intervention within a long-term process of social change and argued that even if RtS had little immediate impact on local drinking behaviour, it could still contribute to an escalation of political activity and public awareness around alcohol-related harms. One hostel manager said that RtS could be “*part of a whole move of this awareness of how dangerous drink is. So I think it will have an effect but I think it's going to be part of a long term social change. I think in the short term it's going to be very patchy.*” [Thomas, Hostel manager]

Thomas, in common with other service providers used the example of tobacco policy, which was framed as a slow cumulative process beginning with small scale and often ineffective interventions that, nonetheless, contributed to greater political and cultural awareness about the harms of smoking, leading eventually to more effective interventions. A variant of this narrative was put forward by another service provider:

*...and then the culture has changed as well...because the first place that implemented no smoking in public places was California and I think at the time in England the general perception was it was almost like a communist style, sort of undemocratic thing that would be unimaginable...[It] was a shock but then the culture changed and actually now everyone just thinks it's the norm. [Patrick, Alcohol service professional]*

#### *Ethical considerations of targeted policies*

Both service providers and drinkers believed RtS contributed to a broader strategy of targeting disadvantaged populations. Several service providers justified this targeting on the grounds that people who consume super-strength disproportionately use public services, cause anti-social behaviour and are vulnerable to environmental health risks:

*...people that are actually dying or you know been affecting the community in a big way, I think those are the specific target groups that they're looking at. Those people that are actually impacting on the community causing a lot of disruption, causing a lot of offending. [Jessica, Hostel manager]*

Amongst the drinkers there was confusion surrounding why super-strength drinks were targeted when other drinks such as spirits or wine have higher alcohol contents. Several homeless participants had the view that targeting the most disadvantaged with availability restrictions was a social injustice, and one hostel manager expressed concerns about how alcohol-related harms amongst more affluent members of the population were not addressed by the intervention:

*It's a bit unfair...the middle, upper class [have their] nose up in the air with a nice glass of claret or a glass of rosé or whatever, they drink as much as I do. So, please do not tell me I'm the only alcoholic [Kevin, Drinker]*

1  
2  
3  
4 *some people could argue it could be a bit of a class sort of thing really demonising*  
5 *poor people* [Nathan, Hostel manager]  
6  
7

## 8 **DISCUSSION**

9 We have conducted qualitative research to obtain different stakeholder perspectives on the  
10 potential impacts of RtS following its implementation in a London borough. We have deliberately  
11 constructed a pluralistic account based on the understanding that the intervention is an event in a  
12 complex system. Within the four intersecting contextual domains (individual, local environment,  
13 service provision and policy), RtS is assumed to make both positive and negative contributions in  
14 advancing health and social policy goals relating to reducing alcohol harms.  
15  
16

17 Participants suggested that at the individual level, the target population were likely to adopt  
18 substitution behaviours to seek to reduce the impact of the intervention on their intoxication. Such  
19 adaptations could involve finding stores still selling super-strengths or continuing to shop at  
20 participating stores and substituting drinks, including drinks with higher prices. We hypothesise that  
21 depending on the adaptive response of its customers, shopkeepers may consider RtS to be more or  
22 less commensurable with their business interests, which may feedback on the retail sector's future  
23 willingness to engage with this initiative. Participants also suggested, with some differences of  
24 opinion, responses around illicit drug and substance abuse, or crime and anti-social behaviours that  
25 could potentially affect individuals, retailers and communities.  
26  
27

28 At the service level, we found different viewpoints about how successfully the intervention had  
29 linked with other services. Some participants believed that RtS offered opportunities for public and  
30 private sector stakeholders to strengthen or modify relationships in order to further encourage  
31 joined-up services to tackle deeply entrenched alcohol problems.  
32

33 At the policy-level, drawing on the history of tobacco policymaking, some participants suggested  
34 that local initiatives such as RtS could be a contributor to political and cultural changes surrounding  
35 the acceptability of harmful alcohol consumption. From this perspective, small interventions were  
36 considered to be important as part of a cumulative escalation of action and debate around alcohol: a  
37 different kind of impact to that normally considered by intervention effectiveness evaluations. As  
38 further evidence of this 'escalation', the Portman Group, a UK alcohol trade association, recently  
39 issued guidance discouraging the sale of single cans of super-strengths that exceed daily drinking  
40 guidelines for men and women.(27-29) However, both drinkers and service providers in this study  
41 highlighted how the highly targeted product restriction ignored other more commonly consumed  
42 alcohol products, and the problems of excessive drinking that exist across the whole population.  
43  
44

45 Findings from our study add to a small body of research on highly targeted alcohol availability  
46 interventions. For example, in remote Australian communities where the sale of cask wine in  
47 containers over 4 litres was banned, mixed methods evaluations found that while there was  
48 significant substitution, either to other drinks or to other localities, that there was still an overall  
49 reduction in alcohol consumption not entirely offset by the substitution.(30-32) Two UK studies  
50 exploring public acceptability of policies to reduce alcohol consumption highlighted criticism that  
51 availability interventions fail to address underlying reasons for excessive alcohol consumption.(33,  
52 34) Participants reported that people who are sufficiently motivated will circumvent  
53 interventions,(34) a process which may encourage uptake of additional risky behaviours.(33) Our  
54 findings on individual-level responses corroborate these findings.  
55

59  
60

### Limitations

We interviewed homeless alcohol consuming individuals who reside in hostels for pragmatic reasons, but recognise that other groups, such as rough sleepers and independent-living super-strength consumers, are also affected by the intervention. Our participants already engage, to varying degrees, with some services, by virtue of living within the hostel system. Drinkers who live independently, or are disengaged from services, may have provided different accounts of how they experienced the intervention. Informal discussions with implementers revealed that they felt they did engage with a range of alcohol and homeless services, whereas our findings from the service providers provide a different view. Future work could fruitfully bring together these perspectives.

Our sample, though small, was sufficient for us to generate multiple theorised pathways to impact including substitution behaviours and other responses to RtS which, we believe, can be plausibly considered by practitioners in other settings. The study does not attempt to measure the extent of these behaviours or make generalisable conclusions about intervention effectiveness; a quantitative approach would be required for those conclusions.

### CONCLUSIONS

We have shown a worked example of how public health researchers can usefully apply a complex system perspective to unpack how interventions may lead to multiple impacts. We argue that the small scale of implementation and the limited range of products affected make it plausible that RtS could, by itself, make only a modest impact on alcohol harms, based on the apparent ease and willingness of drinkers to use substitution behaviours to circumvent the availability restrictions. These individual responses are reactions to both the physical and economic dimensions of alcohol availability. An approach that ensured full shop compliance across larger geographical scales could restrict drinkers' ability to substitute to non-compliant shops. Hence we hypothesise that the local and voluntary nature of RtS could be barriers to effectiveness, although a well-conducted quantitative evaluation is required to test this theory.

However, our systems approach has also encouraged us to consider effects on services and policy as well as effects on individual drinkers. The intervention is believed by some front line staff to have the potential to facilitate new forms of cross-sectorial stakeholder activity, to promote further awareness of alcohol harms and/or to increase political interest in availability interventions. In this way, RtS could form part of an accumulation of activities that, over time, lead to new activities and relationships between sectors. Hence, some stakeholders suggest that a small, local intervention such as RtS can potentially contribute to wider system changes irrespective of, or indirectly related to, the intervention's effectiveness in achieving its formally stated goals. This viewpoint raises methodological challenges for future local evaluations as it cannot be addressed by simply measuring intervention effects on a small number of pre-specified outcomes.

### ACKNOWLEDGEMENTS

We would like to acknowledge Professor Mark Petticrew for his helpful comments on this paper.

### FUNDING STATEMENT

This work was supported by the National Institute for Health Research (NIHR)'s School for Public Health Research (SPHR). The views expressed are those of the authors and not necessarily those of the NHS, the NIHR or the Department of Health.

### DATA SHARING STATEMENT

No additional data available.

### COMPETING INTERESTS

DM is a joint Public Health Strategist/Lecturer covering the intervention area. At the time of writing, CS was a Public Health Strategist in the intervention area and was involved in developing, supporting and evaluating the work discussed in the article.

### CONTRIBUTORSHIP STATEMENT

EM conducted the interviews and focus group, led on the analysis and drafted this manuscript. ME contributed to the analysis and to the manuscript draft. All authors have provided input into data interpretation, critically revised the manuscript and approved the final version.

**Word count:** 4,989

**ABSTRACT**

**Objectives:** Increasingly English local authorities have encouraged the implementation of an intervention called 'Reducing the Strength' (RtS) whereby off-licences voluntarily stop selling inexpensive 'super-strength' ( $\geq 6.5\%$  ABV) beers and ciders. We conceptualised RtS as an event within a complex system in order to identify pathways by which the intervention may lead to intended and unintended consequences.

**Design:** A qualitative study including a focus group and semi-structured interviews.

**Setting:** An inner-London local authority characterised by a high degree of residential mobility, high levels of social inequality and a large homeless population. Intervention piloted in three areas known for street drinking with a high alcohol outlet density.

**Participants:** Alcohol service professionals, homeless hostel employees, street-outreach managers and homeless alcohol consumers (n=30).

**Results:** Participants describe a range of substitution behaviours to circumvent alcohol availability restrictions including consuming different drinks, finding alternative shops, using drugs or committing crimes to purchase more expensive drinks. Service providers suggested the intervention delivered in this local authority missed opportunities to encourage engagement between the council, alcohol services, homeless hostels and off-licence stores. Some participants believed small-scale interventions such as RtS may contribute cross-sectorial working and to long-term cultural changes around drinking, although they may also entrench the view that 'problem drinking' only occurs in certain population groups.

**Conclusions:** RtS may have limited individual-level health impacts if the target populations remain willing and able to consume alternative means of intoxication as a substitute for super-strength products. However, RtS may also lead to wider system changes not directly related to the consumption of super-strengths and their assumed harms.

**Strengths and limitations of this study:**

- This study utilises a unique perspective by drawing on complexity theory to develop multi-level theories of change for an innovative alcohol availability intervention.
- Our qualitative methods lead to a pluralistic account of how the alcohol availability intervention may impact multiple outcomes and contexts.
- The study was conducted in a single English local authority, which allows for greater depth of analysis, but may limit the generalisability of the findings.
- The sample of homeless people is relatively small but gives some of the most vulnerable and hard-to-reach community members a voice in the research.

## INTRODUCTION

Alcohol is a global health concern, a causal factor in over 200 diseases and conditions (1) and contributes to healthcare costs,(2) crime and disorder and losses of workplace productivity.(3) Interventions that restrict the economic or physical availability of alcohol have been recommended to reduce alcohol-related harms.(4-7) There is a pattern of research from different national settings supporting the case for national and mandatory interventions that restrict alcohol availability.(5) Nonetheless, alcohol availability interventions are frequently delivered on a local and/or voluntary basis.(5, 8) Reviews of alcohol availability interventions and health have found that the evidence base relating to local and voluntary initiatives is inconsistent and underdeveloped.(5) This may be symptomatic of a broader perceived shortage of evidence to support public health decision-making relevant to local government and multi-sectorial initiatives.(9)

One recent UK alcohol intervention that embodies both localist and voluntary characteristics is called 'Reducing the Strength' (RtS). With the encouragement of local authorities, shops licensed to sell alcohol for off-premise consumption ('off-licenses') voluntarily stop selling inexpensive high strength ( $\geq 6.5\%$  ABV) beers and ciders, including products marketed as 'super-strengths' or 'white ciders'. These products and their marketing have been said to encourage excessive drinking and harmful behaviours amongst vulnerable sub-populations.(10-12) A single 500ml can of super-strength can exceed the UK health guidelines for daily alcohol consumption, whilst a single 3 litre bottle can exceed the weekly guidelines.(13) Guidance for implementing RtS identifies street and homeless drinkers as target populations (14) based on assumptions about their consumption of these low-cost products, their vulnerability to alcohol addiction and perceived social problems around street drinking.(10, 15) RtS was first launched in Ipswich in 2012, and by early 2015 had been implemented in approximately eighty local authorities across England,(16) with some variation between areas with regards to the super-strength products targeted and linkages with services for the targeted populations.(14)

Availability modifications, such as RtS, are typically population-level interventions designed to encourage or compel changes in alcohol purchasing, consumption and health impacts.(4) In the case of RtS, both the physical and economic availability may be affected by the removal of cheap strong drinks from shops within a specific location. If many stores in a local area participate and remove super-strengths from their shelves, the variety of different types of alcohol available for purchase in that area will be reduced. The intervention also attempts to remove some of the very cheapest (measured as cost per unit of alcohol) beverages from the market, which would raise the price of the least expensive alcohol beverage available in participating shops. Even though the intervention itself may represent a relatively simple change to the local alcohol environment, the response of target populations and other agents within that environment is potentially complex.

Rickles, Hawe and others (17, 18) have argued that neighbourhood and community interventions can often be considered 'events' in complex systems that may trigger chains of responses and relational changes between individuals or groups.(17, 19) The complex system perspective argues that the most significant aspect of complexity lies not in the intervention itself, but in the system into which the intervention is introduced.(20) Evaluating the impact of events within the system may involve monitoring how different agents within the system respond, considering both intended and unintended consequences, and understanding how responses can potentially dampen or amplify the capacity of the intervention to contribute to system changes.(21, 22) In this paper, we have conceptualised RtS as an event in a complex system.

This study explores how RtS was perceived and experienced by the target population of homeless drinkers and by service providers who work closely with this population. The aim is not to measure effects but rather to utilise a systems perspective to qualitatively explore how RtS may lead to

intended and unintended consequences within the system in which it was implemented. In this paper we focus on the experiences of homeless drinkers and service providers who work with those drinkers. We consider how both groups perceive the ways in which RtS may (or may not) influence their own activities, their peers' and the broader socio-cultural environment that they inhabit.

## METHODS

This study is part of a wider programme of research co-produced with local authority practitioners. Further publications will include qualitative and quantitative findings relating to impacts on retailers and alcohol sales. The current study investigates the intervention from the perspective of a key target population, homeless people, and service providers who work closely with that population. The research was conducted in mid-2014 after the intervention was implemented in late 2013. The study involved a focus group with alcohol service providers and interviews with alcohol service professionals, workers at homeless hostels, street-outreach managers and homeless alcohol consumers (n=30). Ethical approval was obtained from the London School of Hygiene & Tropical Medicine Ethics Committee. All participants were allocated a pseudonym.

Qualitative methods were considered appropriate for identifying a wide range of potentially relevant issues and providing opportunities for participants to introduce themes not considered at the research design stage.<sup>(23)</sup> Evaluators have argued that qualitative research is particularly well suited to capturing the complexity of interventions and systems by unpacking processes by which interventions may trigger system changes.<sup>(24, 25)</sup> This complexity may include multiple and unanticipated outcomes over variable time frames, competing aims and values of stakeholders and target populations and non-linear relationships between contexts, processes and outcomes.<sup>(17)</sup> Qualitative approaches that do not explicitly incorporate a systems lens may still include some or all of these features, but a systems approach encourages a framework for analysis that explicitly focuses on changes to behaviours and relationships between agents at multiple levels in response to an intervention.<sup>(17, 22)</sup> The flexibility of qualitative methodologies can also help researchers overcome some of the barriers to evaluating local health policy innovation, which can include small delivery scales, rapid delivery timescales <sup>(26)</sup> and a demand from local decision-makers for evidence that is sufficiently contextually rich to be recognisable to them as 'local'.<sup>(9, 27)</sup>

### Intervention and setting

The study focused on an inner-London borough characterised by high population density, social inequality and a high degree of residential mobility. In late 2013, off-licence shops in three 'hot spots' for street drinking were asked to voluntarily stop selling super-strength products. Local authority data showed these areas to have a very high alcohol outlet density and alcohol retailers in these areas primarily consist of small, independent 'newsagent' stores who open late and rely on alcohol as a large proportion of their total revenue. According to a local authority audit, super-strength products were often, although not always, the cheapest alcohol products available for purchase in these stores. The RtS intervention was planned and implemented by the borough's council and police licensing teams and supported by community safety officers. The intervention has five stated aims, which are presented in Table 1.

**Table 1: RtS aims in one English local authority**

- |   |
|---|
| <ol style="list-style-type: none"><li>1. To remove 'super-strength' from off-licences;</li><li>2. Voluntary variation of existing licences to include a condition not to sell 'super-strength';</li><li>3. To reduce crime and anti-social behaviour (specifically street drinking and begging);</li><li>4. To reduce alcohol-specific admissions including repeat admissions;</li><li>5. To highlight the dangers of alcohol, particularly super-strength alcohol, to residents.</li></ol> |
|---|

1  
2  
3 Prior to the intervention 40% of the 78 off-licenses in the RtS area sold super-strength products.  
4 Following the intervention launch event, implementers reported that all but two off-licences agreed  
5 to participate in the scheme. At six months follow-up, implementers reported around 90% of off-  
6 licences continued to participate, and considered this a substantial reduction in super-strength  
7 availability for those areas.  
8

### 9 **Recruitment and data collection**

10 Homeless people are recognised as vulnerable and hard-to-reach groups, raising ethical and practical  
11 issues affecting recruitment and data collection. Service providers were interviewed to draw from  
12 their knowledge of homeless drinking behaviours but also to allow identification of contrasting  
13 perspectives between the two groups of participants. Participants were recruited through  
14 stakeholder contacts and direct approaches to hostels and services. Homeless participants received  
15 information about the study from service providers with an invitation, but no obligation to take part.  
16 The mediating role of the service providers meant we were unable to track participants (homeless or  
17 otherwise) that were informed of the study but declined to take part. Participants all received an  
18 information sheet and verbal information about the study; all recruitment was based on voluntary  
19 informed consent.  
20

21  
22 Most of the fieldwork involved semi-structured individual interviews conducted by EM (a research  
23 fellow with prior experience of interviews, focus groups and qualitative analysis); each participant  
24 was interviewed once. Service providers were not present when homeless participants were  
25 interviewed and participants were not interviewed in front of their peers. Some alcohol service  
26 professionals requested a focus group for logistical and time-management reasons. Service provider  
27 topic guides included sections on alcohol and homeless service provision, homeless peoples'  
28 drinking behaviours and the RtS intervention. Drinker topic guides covered similar themes but  
29 focused more on the participants' own behaviours and experiences. We asked specifically about  
30 super-strength consumption, but also more generally about how drinkers would respond to  
31 restricted alcohol availability. Interviews were conducted in a private area work settings or hostels,  
32 audio-recorded and transcribed. The researcher also made fieldnotes during and after each  
33 interview. Homeless participants received a £10 voucher as compensation for their time.  
34  
35

### 36 **Analysis**

37 A total of 723 minutes of audio was recorded and transcribed; this figure excludes tours around five  
38 homeless hostels during which participants provided the researcher with background information.  
39 The first author coded the transcripts in NVivo 10 using the interview guide to group major themes;  
40 a second researcher double-checked the coding. We then utilised concepts from complexity theory  
41 to deductively code the transcripts. Specifically, we have used participant perspectives to identify  
42 theories of change – including participants' views on what constitutes potential intended and  
43 unintended consequences that could follow from the implementation of RtS.  
44  
45

## 46 **RESULTS**

47 Thirty people participated in the study (Table 2). The nine alcohol-consuming hostel residents were  
48 predominantly male and seven had been in the hostel system for over a year. Six reported previous  
49 experience of rough sleeping. Four stated that they were regular (daily) consumers of super-  
50 strengths whilst others consumed it less frequently, preferring alternatives such as wine, vodka, or  
51 regular beer and cider. Twenty-one service professionals participated in the study, eleven in a focus  
52 group at an alcohol service centre and ten individual semi-structured interviews were conducted  
53 with professionals in other services.  
54  
55

### 56 **Table 2: Number of participants**

	Individual interview	Focus group	Males	Females
<b>Participants</b>				
Homeless drinkers	9	0	8	1
Alcohol service managers and staff	2	11	4	9
Hostel managers and staff	6	0	2	4
Street-based services manager	2	0	2	0

Utilising participant perspectives, we structured our analysis to consider different levels or domains at which the intervention constitutes an 'event' and where participants saw potential impacts stemming from the implementation of RtS. This includes the levels of the individual and service provision, as well as potential broader socio-cultural implications. The levels of the individual drinker (Figure 1) and service provision (Figure 2) were inherently built into our sampling strategy, whereas the broader socio-cultural context emerged from participants' accounts.

#### FIGURE 1 ABOUT HERE

##### Findings at the individual level

Homeless and service providers presented a range of opinions about which groups they thought the intervention targeted, which included but was not limited to street drinkers, rough sleepers and hostel residents. More broadly, participants tended to assume that super-strength products were consumed by disadvantaged, middle-aged males with high levels of alcohol dependency described by various service providers as "problematic", "physically dependent" or "hardcore entrenched" drinkers.

Drinkers, and some service providers, had noticed the reduction of super-strength availability within the intervention areas and explained that only a limited number of shops continued to sell the products:

*I don't know if you're aware of that as well, but you know the strong lagers, i.e. the Special Brew and the Skol Super Light, all the 24 hours shops around here, all the police have completely stopped them from selling it, you can't buy any strong beers anywhere around here anymore. You know, except for a very select couple.*  
[Christopher, Drinker]

*now the Reduce the Strength campaign is in effect so a lot of these are no longer selling those brands that I just mentioned. However, there are still one or two doing it.* [Luke, Street-outreach manager]

Participants discussed this substantial, but not absolute, restriction in super-strength availability as an event that could lead to a number of substitution responses. Drinkers described still being able to purchase super-strengths by switching from compliant to non-compliant shops. For example, Timothy described how super-strength drinkers walk a greater distance to find stores that continue to sell super-strengths:

1  
2  
3 *That's what everyone does at the minute, they walk out further afield to get it...they*  
4 *go into the shops that still do sell it, which is only like a handful, not even a handful, a*  
5 *couple of them. [Timothy, Drinker]*  
6

7 Drinkers disagreed about whether the necessity of walking longer distances would affect their  
8 purchasing behaviour. One said *"I'll walk as far as I can to get my same beer,"* [Max, Drinker]  
9 whereas others suggested there was a limit to the distance they would walk and this might vary  
10 depending on time of day. Service providers also reported seeing homeless and street drinkers, and  
11 alcohol-service clients still consuming super-strength products.  
12

13 A second substitution behaviour participants described was substituting drinks within compliant  
14 shops. Without prompting, several drinkers attempted to calculate the ways they could continue to  
15 consume the same number of units of alcohol within stores participating in RtS. Some suggested  
16 they would switch to drinks with higher alcohol contents, such as wine, sherry or vodka. For  
17 example, Christopher, a super-strength drinker, described how drinkers can still purchase vodka at  
18 compliant stores:  
19

20  
21 *You can't buy any strong beers anywhere around here anymore, except for a very*  
22 *select couple, but it hasn't deterred anyone though has it? Christ, yeah, cos they've*  
23 *still got bottles of vodka in there. [Christopher, Drinker]*  
24  
25

26 Other drinkers and service providers, however, questioned whether many homeless drinkers would  
27 be able to budget for the higher cost of a larger bottle of spirits (which were assumed to represent  
28 better value than smaller bottles) or make a bottle last longer than a day.  
29

30  
31 Service providers also hypothesised that if a sufficient number of stores participated in the  
32 intervention, thus resulting in an absolute reduction in the availability of super-strengths, that  
33 drinkers might purchase greater quantities of cheaper, weaker beer or cider. However, drinkers  
34 largely rejected this idea as they perceived such drinks to be insufficiently strong to achieve a feeling  
35 of intoxication, or prevent withdrawal symptoms. One drinker called 'normal' strength beers *"a*  
36 *waste of time"* [Christopher] and another described them as *"piss water"* [Joshua].  
37

38 Several drinkers and service providers also suggested that more drinkers would engage in alternative  
39 substance abuse, as many had histories of co-dependency. This could include illegal drugs or  
40 products not intended for consumption such as cleaning products or solvents:  
41

42  
43 *So I have one beer or one [butane] gas, but what I worry about there is once I've*  
44 *finished that beer, then I've probably by that time nearly gone through half of that*  
45 *one gas...When I really am getting anxiety attacks from the alcohol comedown and*  
46 *all that kind of stuff, the gas really douses it, you know? [Christopher, Drinker]*  
47

48  
49 *I think the people who need alcohol and haven't got any money...can do extreme*  
50 *things [such as] drink a hand sanitizer in hospitals...I think it's a least bad thing if*  
51 *people can drink something that's at least commercially produced and safe. [Lauren,*  
52 *Alcohol service professional]*  
53

54 Participants acknowledged that purchasing more expensive drinks or alternative substances could  
55 result in unintended consequences for drinkers and perhaps the broader community should drinkers  
56 turn to crime or begging to obtain these products. One super-strength drinker, who distanced  
57 himself from these behaviours, argued that other homeless drinkers would *"try and blag or steal, or*  
58  
59  
60

1  
2  
3 *whatever it takes, you know to get it, as I said, it won't make much difference.* [Kevin, Drinker].  
4 Service providers also considered these possibilities, arguing:

5  
6 *I think the other thing that would happen is that you could see offending go up.*  
7 [Lauren, Alcohol service professional]  
8

9  
10 *If the money's not there they might turn to committing crime.* [William, Alcohol  
11 service manager]  
12

13 On the other hand, a hostel employee argued that any potential spike in more visible or risky forms  
14 of crime would only be short lived:

15  
16 *In terms of sustainability it probably depends on the risk associated with whatever*  
17 *they're doing. So things like pickpocketing is quite high risk because you're quite*  
18 *likely to attract the attention of the police and so that's probably not sustainable.*  
19 [Peter, Hostel staff]  
20

## 21 22 **FIGURE 2 ABOUT HERE**

### 23 24 **Findings at the service level:**

25 Within the complex system in which RtS is implemented, there are also consequences for service  
26 provision (Figure 2). The integration of RtS with existing homeless or alcohol services was a  
27 particular concern of service providers who largely saw the intervention as too limited to effectively  
28 address excessive alcohol consumption. Several participants emphasised the need for a holistic  
29 approach to treatment services that address the underlying causes for addiction, such as poverty,  
30 homelessness, relationship breakdown and bereavement:  
31

32  
33 *I don't think [RtS] acknowledges the psychological reasons why people drink, I don't*  
34 *think it acknowledges all the kind of needs that are being met, albeit in a*  
35 *maladaptive way by alcohol.* [Adam, Hostel manager]  
36

37 Service providers who were sceptical about the potential benefit of RtS did note that it might be  
38 used as a tool to engage drinkers who were already seeking help. For example, the intervention  
39 could be used to help talk to their drinkers reducing alcohol consumption in conjunction with  
40 support plans:  
41

42  
43 *it helps us because you could in your harm minimisation support plans say drink at*  
44 *different times, drink a lower strength beer, drink less amount and only go to that*  
45 *shop....if you know they're not selling strong drinks you can make it all part of the*  
46 *task-oriented support plan* [Thomas, Hostel manager]  
47

48 Service providers tended to agree that in this particular roll-out of RtS, there was a missed  
49 opportunity for public services, including the alcohol services, hostel services and the Council, to  
50 engage and interact more closely with the business sector. Some of these service providers had not  
51 heard of RtS and felt that explicit links between different stakeholders could have initiated positive  
52 changes. If implemented to encourage service linkage, RtS was seen as an opportunity to work more  
53 closely with local shop managers to assist dependent drinkers through alcohol supply regulation:  
54

55  
56 *I can't understand why we [the alcohol service] weren't asked to participate because*  
57 *we have a lot of volunteers and services that would have been able to contribute by*  
58  
59  
60

1  
2  
3 *going around to some of the shops as well because I think it's been about trying to*  
4 *get the shop owners to take responsibility for the community. [Eleanor, Alcohol*  
5 *service professional]*  
6  
7

### 8 **RtS within the wider socio-cultural environment**

9 Participants also described how RtS may have implications beyond individual drinkers and service  
10 provision for homeless drinkers. Participants situated RtS within a broader socio-cultural context  
11 which included the retail environment, social norms around drinking and the ethics of targeted  
12 social policies.  
13

#### 14 *The retail environment*

15 The retail sector is integral to the intervention's feasibility and service providers and drinkers alike  
16 described the complex, often reciprocal relationships between drinkers and shops; for example,  
17 participants reported that shopkeepers sometimes give regular drinkers informal credit or special  
18 offers. Some drinkers conveyed a sympathy towards small business owners and argued that  
19 shopkeepers should be able to stock the products they choose. These drinkers argued that shop  
20 keepers might lose profits if they were participated in RtS or were not allowed to sell super-strength  
21 products:  
22  
23

24  
25 *I was in this shop once a few weeks ago and one of the council people were in the*  
26 *shop at the same time as I was there. And he was going, right, you're not allowed to*  
27 *sell this Polish lager anymore because it was strong or something and you're not*  
28 *allowed to sell this one and that one and he was pointing. They should be allowed to*  
29 *sell it...the shopkeeper's going to lose a fortune taking all them off the shelf.*  
30 [Timothy, Drinker]  
31

32 Many service providers also speculated that RtS could harm shopkeepers financially and extended  
33 this to consider how lost profits might be a disincentive to intervention take-up:  
34

35 *And say what incentives could be offered to encourage businesses to sign up because*  
36 *especially, well, for the off-licences down our road high strength alcohol would be a*  
37 *large volume of their trade...that would have a huge impact I imagine. [Peter, Hostel*  
38 *staff]*  
39

#### 40 *Social change: making alcohol the new tobacco*

41 Service providers positioned the intervention within the broader culture of drinking in England. The  
42 participants argued that even if RtS had little immediate impact on local drinking behaviour, it might  
43 still contribute to a long-term process of social change and public awareness around alcohol-related  
44 harms. One hostel manager said that RtS could be "*part of a whole move of this awareness of how*  
45 *dangerous drink is. So I think it will have an effect but I think it's going to be part of a long term*  
46 *social change. I think in the short term it's going to be very patchy.*" [Thomas, Hostel manager]  
47  
48

49 Several providers drew on the history of tobacco and argued that political action and interventions  
50 around smoking ultimately changed cultures around smoking, particularly around the public  
51 acceptability of smoking in public. Service providers saw parallels between tobacco policy and RtS:  
52  
53

54 *...and then the culture has changed as well...because the first place that*  
55 *implemented no smoking in public places was California and I think at the time in*  
56 *England the general perception was it was almost like a communist style, sort of*  
57 *undemocratic thing that would be unimaginable...[It] was a shock but then the*  
58  
59  
60

1  
2  
3 *culture changed and actually now everyone just thinks it's the norm.* [Patrick, Alcohol  
4 service professional]  
5

#### 6 *Ethical considerations of targeted policies*

7 Both service providers and drinkers believed RtS contributed to a broader strategy of  
8 targeting disadvantaged populations. Several service providers justified this targeting on the  
9 grounds that people who consume super-strength disproportionately use public services,  
10 cause anti-social behaviour and are vulnerable to environmental health risks:  
11

12 *...people that are actually dying or you know been affecting the community in a big*  
13 *way, I think those are the specific target groups that they're looking at. Those people*  
14 *that are actually impacting on the community causing a lot of disruption, causing a*  
15 *lot of offending.* [Jessica, Hostel manager]  
16  
17

18 Amongst the drinkers there was confusion surrounding why super-strength drinks were targeted  
19 when other drinks such as spirits or wine have higher alcohol contents. Several homeless  
20 participants had the view that targeting the most disadvantaged with availability restrictions was a  
21 social injustice, and one hostel manager expressed concerns about how alcohol-related harms  
22 amongst more affluent members of the population were not addressed by the intervention:  
23

24 *It's a bit unfair...the middle, upper class [have their] nose up in the air with a nice*  
25 *glass of claret or a glass of rosé or whatever, they drink as much as I do. So, please*  
26 *do not tell me I'm the only alcoholic* [Kevin, Drinker]  
27  
28

29 *some people could argue it could be a bit of a class sort of thing really demonising*  
30 *poor people* [Nathan, Hostel manager]  
31  
32

#### 33 **DISCUSSION**

34 We have conducted qualitative research to obtain different stakeholder perspectives on the  
35 potential impacts of RtS following its implementation in a London borough. We have deliberately  
36 constructed a pluralistic account based on the understanding that the intervention is an event in a  
37 complex system. RtS is assumed to make both positive and negative contributions in advancing  
38 health and social policy goals relating to reducing alcohol harms.  
39

40 Participants suggested that at the individual level, the target population were likely to adopt  
41 substitution behaviours to seek to reduce the impact of the intervention on their intoxication. Such  
42 adaptations could involve finding stores still selling super-strengths or continuing to shop at  
43 participating stores and substituting drinks, including drinks with higher prices. Recent research on  
44 dependent drinkers' purchasing behaviour in Scotland found drinkers seek the cheapest alcohol  
45 beverages from their local stores and adapt their purchasing behaviour based on price, the alcohol  
46 environment and drink preferences. The authors conclude that "heavy drinkers are astute, skilled  
47 and flexible shoppers".(28 p.1578) Our findings on substitution behaviours in response to RtS  
48 corroborate these conclusions. Participants also suggested, with some differences of opinion,  
49 responses around illicit drug and substance abuse, or crime and anti-social behaviours that could  
50 potentially affect individuals, retailers and communities.  
51  
52

53 At the service level, we found different viewpoints about how successfully the intervention had  
54 linked with other services. Some participants believed that RtS offered opportunities for public and  
55 private sector stakeholders to strengthen or modify relationships in order to further encourage  
56 joined-up services to tackle deeply entrenched alcohol problems.  
57  
58  
59  
60

1  
2  
3  
4 Participants also contextualised the intervention within a broader socio-cultural environment.  
5 Drawing on the history of tobacco policymaking, some participants suggested that local initiatives  
6 such as RtS could be a contributor to cultural changes surrounding the acceptability of harmful  
7 alcohol consumption. From this perspective, small interventions were considered to be important as  
8 part of a cumulative escalation of action and debate around alcohol: a different kind of impact to  
9 that normally considered by intervention effectiveness evaluations. As further evidence of this  
10 'escalation', the Portman Group, a UK association funded by the alcohol industry, recently issued  
11 guidance discouraging the sale of single cans of super-strengths that exceed daily drinking guidelines  
12 for men and women.(29-31) However, both drinkers and service providers in this study highlighted  
13 how the highly targeted product restriction ignored other more commonly consumed alcohol  
14 products, and the problems of excessive drinking that exist across the whole population. Policies  
15 such as RtS may be seen as indicative of cultural associations of 'problem drinking' with more  
16 marginalised populations.  
17

18  
19 Findings from our study add to a small body of research on highly targeted alcohol availability  
20 interventions. For example, in remote Australian communities where the sale of cask wine in  
21 containers over 4 litres was banned, mixed methods evaluations found that while there was  
22 significant substitution, either to other drinks or to other localities, that there was still an overall  
23 reduction in alcohol consumption not entirely offset by the substitution.(32-34) Two UK studies  
24 exploring public acceptability of policies to reduce alcohol consumption highlighted criticism that  
25 availability interventions fail to address underlying reasons for excessive alcohol consumption.(35,  
26 36) Participants reported that people who are sufficiently motivated will circumvent  
27 interventions,(36) a process which may encourage uptake of additional risky behaviours.(35) Our  
28 findings on individual-level responses corroborate these findings.  
29  
30

### 31 32 **Limitations**

33 We interviewed homeless alcohol consuming individuals who reside in hostels for pragmatic  
34 reasons, but recognise that other groups, such as rough sleepers and independent-living super-  
35 strength consumers, are also affected by the intervention. Our participants already engage, to  
36 varying degrees, with some services, by virtue of living within the hostel system. Drinkers who live  
37 independently, or are disengaged from services, may have provided different accounts of how they  
38 experienced the intervention. Informal discussions with implementers revealed that they felt they  
39 did engage with a range of alcohol and homeless services, whereas our findings from the service  
40 providers provide a different view. Future work could fruitfully bring together these perspectives.  
41  
42

43 We utilised a single case study site. The choice between a single or comparative case study is to  
44 some extent a trade-off between depth of analysis in a single site and greater breadth that may  
45 result from multiple sites. Our sample, though small, was sufficient for us to generate multiple  
46 theorised pathways to impact including substitution behaviours and other responses to RtS which,  
47 we believe, can be plausibly considered by practitioners in other settings. We may speculate as to  
48 whether or not our findings covered all possible pathways (and so claim data saturation) but we  
49 have no clear way of determining this. Those pathways we did identify tended to recur in multiple  
50 interviews and gave us confidence that we had identified responses that appear particularly relevant  
51 for theorising potential impacts.  
52

53  
54 Some of the participants' responses were grounded in direct personal experience, but some less so.  
55 Although the intervention achieved high levels of compliance from shops, participants reported  
56 being able to continue purchasing super-strength products with relative ease. Whilst this was itself  
57 an important finding, we also asked participants about their hypothetical responses, should RtS be  
58  
59  
60

1  
2  
3 implemented by all local shops. It might be assumed that when participants' responses are grounded  
4 in their experience this may constitute more powerful evidence than the speculative responses,  
5 although both shed light on how they perceive the intervention – both in its current form and in a  
6 hypothetical more full realised form – and both are subject to potential biases or may be interpreted  
7 as telling us more about how people represent themselves than how they actually behave.(37)  
8

9  
10 We have utilised interviews and a focus group to obtain participant perspectives on intended and  
11 unintended consequences following the implementation of RtS. Given the sensitive nature of the  
12 topic, and some of the behaviours we asked about, there is a potential for social desirability bias.  
13 While we recognise this as a limitation that may have been addressed through the use of  
14 ethnographic methods, we also note that participants spoke openly about their experiences and  
15 behaviour, at times presenting themselves in a 'negative' light.  
16

17 Whilst our study identified different types of substitution behaviours that could potentially be used  
18 to circumvent the intervention, additional qualitative and quantitative research is required to  
19 measure the extent to which different types of substitution occurred.  
20

## 21 22 **CONCLUSIONS**

23 We argue that the small scale of implementation and the limited range of products affected make it  
24 plausible that RtS could, by itself, make only a modest impact on alcohol harms, based on the  
25 apparent ease and willingness of drinkers to use substitution behaviours to circumvent the  
26 availability restrictions. These individual responses are reactions to both the physical and economic  
27 dimensions of alcohol availability. An approach that ensured full shop compliance across larger  
28 geographical scales could restrict drinkers' ability to substitute to non-compliant shops. Hence we  
29 hypothesise that the local and voluntary nature of RtS could be barriers to effectiveness, although a  
30 well-conducted quantitative evaluation is required to test this.  
31  
32

33 However, our systems approach has also encouraged us to consider effects on services as well as  
34 effects on individual drinkers. Some front line staff believed that RtS could facilitate new forms of  
35 engagement between public and private sector interests and promote further awareness of alcohol  
36 harms. Hence, some stakeholders suggest that a small, local intervention such as RtS can potentially  
37 contribute to wider system changes irrespective of, or indirectly related to, the intervention's  
38 effectiveness in achieving its formally stated goals.  
39  
40

## 41 42 **ACKNOWLEDGEMENTS**

43 We would like to acknowledge Professor Mark Petticrew for his helpful comments on this paper.  
44

## 45 46 **FUNDING STATEMENT**

47 This work was supported by the National Institute for Health Research (NIHR)'s School for Public  
48 Health Research (SPHR). The views expressed are those of the authors and not necessarily those of  
49 the NHS, the NIHR or the Department of Health.  
50

## 51 52 **DATA SHARING STATEMENT**

53 No additional data available.  
54

## 55 56 **COMPETING INTERESTS**

57 DM is a joint Public Health Strategist/Lecturer covering the intervention area. At the time of writing,  
58 CS was a Public Health Strategist in the intervention area and was involved in developing, supporting  
59 and evaluating the work discussed in the article.  
60

## CONTRIBUTORSHIP STATEMENT

EM (MSc) conducted the interviews and focus group, led on the analysis and drafted this manuscript. ME (PhD) contributed to the analysis and to the manuscript draft. EM (MSc), DM (PhD), CS (MSc), ME (PhD) have provided input into data interpretation, critically revised the manuscript and approved the final version.

**Word count:** 5,050

**ABSTRACT**

**Objectives:** Increasingly English local authorities have encouraged the implementation of an intervention called 'Reducing the Strength' (RtS) whereby off-licences voluntarily stop selling inexpensive 'super-strength' ( $\geq 6.5\%$  ABV) beers and ciders. We conceptualised RtS as an event within a complex system in order to identify pathways by which the intervention may lead to intended and unintended consequences.

**Design:** A qualitative study including a focus group and semi-structured interviews.

**Setting:** An inner-London local authority characterised by a high degree of residential mobility, high levels of social inequality and a large homeless population. Intervention piloted in three areas known for street drinking with a high alcohol outlet density.

**Participants:** Alcohol service professionals, homeless hostel employees, street-outreach managers and hostel dwelling homeless alcohol consumers (n=30).

**Results:** Participants describe a range of substitution behaviours to circumvent alcohol availability restrictions including consuming different drinks, finding alternative shops, using drugs or committing crimes to purchase more expensive drinks. Service providers suggested the intervention delivered in this local authority missed opportunities to encourage engagement between the council, alcohol services, homeless hostels and off-licence stores. Some participants believed small-scale interventions such as RtS may facilitate new forms of engagement between public and private sector interests and contribute to long-term cultural changes around drinking, although they may also entrench the view that 'problem drinking' only occurs in certain population groups.

**Conclusions:** RtS may have limited individual-level health impacts if the target populations remain willing and able to consume alternative means of intoxication as a substitute for super-strength products. However, RtS may also lead to wider system changes not directly related to the consumption of super-strengths and their assumed harms.

**Strengths and limitations of this study:**

- This study utilises a unique perspective by drawing on complexity theory to develop multi-level theories of change for an innovative alcohol availability intervention.
- Our qualitative methods lead to a pluralistic account of how the alcohol availability intervention may impact multiple outcomes and contexts.
- The study was conducted in a single English local authority, which allows for greater depth of analysis, but may limit the generalisability of the findings.
- The sample of hostel dwelling homeless people is relatively small but gives some of the most vulnerable and hard-to-reach community members a voice in the research.

## INTRODUCTION

Alcohol is a global health concern, a causal factor in over 200 diseases and conditions (1) and contributes to healthcare costs,(2) crime and disorder and losses of workplace productivity.(3) Interventions that restrict the economic or physical availability of alcohol have been recommended to reduce alcohol-related harms.(4-7) There is a pattern of research from different national settings supporting the case for national and mandatory interventions that restrict alcohol availability.(5) Nonetheless, alcohol availability interventions are frequently delivered on a local and/or voluntary basis.(5, 8) Reviews of alcohol availability interventions and health have found that the evidence base relating to local and voluntary initiatives is inconsistent and underdeveloped.(5) This may be symptomatic of a broader perceived shortage of evidence to support public health decision-making relevant to local government and multi-sectorial initiatives.(9)

One recent UK alcohol intervention that embodies both localist and voluntary characteristics is called 'Reducing the Strength' (RtS). With the encouragement of local authorities, shops licensed to sell alcohol for off-premise consumption ('off-licenses') voluntarily stop selling inexpensive high strength ( $\geq 6.5\%$  ABV) beers and ciders, including products marketed as 'super-strengths' or 'white ciders'. These products and their marketing have been said to encourage excessive drinking and harmful behaviours amongst vulnerable sub-populations.(10-12) At the time of the intervention's implementation, a single 500ml can of super-strength could exceed the (now former) UK health guidelines for daily alcohol consumption, whilst a single 3 litre bottle of cider could exceed the weekly guidelines.(13)

RtS was first launched in Ipswich in 2012, and by early 2015 had been implemented in approximately eighty local authorities across England,(14) with some variation between areas with regards to the super-strength products targeted and linkages with services for the targeted populations.(15) Guidance for implementing RtS identifies street and homeless drinkers as target populations (15) based on assumptions about their consumption of these low-cost products, their vulnerability to alcohol addiction and perceived social problems around street drinking.(10, 16) Numerous local studies of street drinkers and homelessness in the UK have pointed out that these are intersecting but not identical population subgroups.(17, 18) Furthermore homelessness can take different forms including rough sleeping, living in hostels, staying with friends and family, and often involves a residential instability that may lead to frequent changes in residential status.(19-22)

Availability modifications, such as RtS, are typically population-level interventions designed to encourage or compel changes in alcohol purchasing, consumption and health impacts.(4) In the case of RtS, both the physical and economic availability may be affected by the removal of cheap strong drinks from shops within a specific location. If many stores in a local area participate and remove super-strengths from their shelves, the variety of different types of alcohol available for purchase in that area may be reduced. The intervention also attempts to remove some of the very cheapest (measured as cost per unit of alcohol) beverages from the market, which would raise the price of the least expensive alcohol beverage available in participating shops. Even though the intervention itself may represent a relatively simple change to the local alcohol environment, the response of target populations and other agents within that environment is potentially complex.

Rickles, Hawe and others (23, 24) have argued that neighbourhood and community interventions can often be considered 'events' in complex systems that may trigger chains of responses and relational changes between individuals or groups.(23, 25) The complex system perspective argues that the most significant aspect of complexity lies not in the intervention itself, but in the system into which the intervention is introduced.(26) Evaluating the impact of events within the system may involve monitoring how different agents within the system respond, considering both intended and unintended consequences, and understanding how responses can potentially dampen or amplify the

1  
2  
3 capacity of the intervention to contribute to system changes.(27, 28) In this paper, we have  
4 conceptualised RtS as an event in a complex system.  
5

6 This study explores how RtS was perceived and experienced by the target population of homeless  
7 drinkers and by service providers who work closely with this population. The aim is not to measure  
8 effects but rather to utilise a systems perspective to qualitatively explore how RtS may lead to  
9 intended and unintended consequences within the system in which it was implemented. For  
10 practical reasons we have focused on hostel dwelling homeless people, acknowledging that this sub-  
11 group is associated with street drinking but still represents only one type homelessness and one type  
12 of street drinker.(19-22) We also focus on the views and experiences of service providers who work  
13 with those drinkers. We consider how both groups perceive the ways in which RtS may (or may not)  
14 influence their own activities, their peers' and the broader socio-cultural environment that they  
15 inhabit.  
16

## 17 18 **METHODS**

19 This study is part of a wider programme of research co-produced with local authority practitioners.  
20 Further publications will include qualitative and quantitative findings relating to impacts on retailers  
21 and alcohol sales. The current study investigates the intervention from the perspective of a key  
22 target population, homeless people, and service providers who work closely with that population.  
23 The research was conducted in mid-2014 after the intervention was implemented in late 2013. The  
24 study involved a focus group with alcohol service providers and interviews with alcohol service  
25 professionals, workers at homeless hostels, street-outreach managers and hostel dwelling alcohol  
26 consumers (whom we refer to as 'homeless') (n=30). Ethical approval was obtained from the London  
27 School of Hygiene & Tropical Medicine Ethics Committee. All participants were allocated a  
28 pseudonym.  
29  
30

31 Qualitative methods were considered appropriate for identifying a wide range of potentially relevant  
32 issues and providing opportunities for participants to introduce themes not considered at the  
33 research design stage.(29) Evaluators have argued that qualitative research is particularly well suited  
34 to capturing the complexity of interventions and systems by unpacking processes by which  
35 interventions may trigger system changes.(30, 31) This complexity may include multiple and  
36 unanticipated outcomes over variable time frames, competing aims and values of stakeholders and  
37 target populations and non-linear relationships between contexts, processes and outcomes.(23)  
38 Qualitative approaches that do not explicitly incorporate a systems lens may still include some or all  
39 of these features, but a systems approach encourages a framework for analysis that explicitly  
40 focuses on changes to behaviours and relationships between agents at multiple levels in response to  
41 an intervention.(23, 28) The flexibility of qualitative methodologies can also help researchers  
42 overcome some of the barriers to evaluating local health policy innovation, which can include small  
43 delivery scales, rapid delivery timescales (32) and a demand from local decision-makers for evidence  
44 that is sufficiently contextually rich to be recognisable to them as 'local'.(9, 33)  
45  
46

## 47 **Intervention and setting**

48 The study focused on an inner-London borough characterised by high population density, social  
49 inequality and a high degree of residential mobility. In late 2013, off-licence shops in three 'hot  
50 spots' for street drinking were asked to voluntarily stop selling super-strength products. Local  
51 authority data showed these areas to have a very high alcohol outlet density and alcohol retailers in  
52 these areas primarily consist of small, independent 'newsagent' stores who open late and rely on  
53 alcohol as a large proportion of their total revenue. According to a local authority audit, super-  
54 strength products were often, although not always, the cheapest alcohol products available for  
55 purchase in these stores. The RtS intervention was planned and implemented by the borough's  
56  
57  
58  
59  
60

council and police licensing teams and supported by community safety officers. The intervention has five stated aims, which are presented in Table 1.

**Table 1: RtS aims in one English local authority**

1. To remove 'super-strength' from off-licences;
2. Voluntary variation of existing licences to include a condition not to sell 'super-strength';
3. To reduce crime and anti-social behaviour (specifically street drinking and begging);
4. To reduce alcohol-specific admissions including repeat admissions;
5. To highlight the dangers of alcohol, particularly super-strength alcohol, to residents.

Prior to the intervention 40% of the 78 off-licenses in the RtS area sold super-strength products. Following the intervention launch event, implementers reported that all but two off-licences agreed to participate in the scheme. At six months follow-up, implementers reported around 90% of off-licences continued to participate, and considered this a substantial reduction in super-strength availability for those areas.

### Recruitment and data collection

Homeless people are recognised as vulnerable and hard-to-reach groups, raising ethical and practical issues affecting recruitment and data collection. Service providers were interviewed to draw from their knowledge of homeless drinking behaviours but also to allow identification of contrasting perspectives between the two groups of participants. Participants were recruited through stakeholder contacts and direct approaches to hostels and services. Homeless participants received information about the study from service providers with an invitation, but no obligation to take part. The mediating role of the service providers meant we were unable to track participants (homeless or otherwise) that were informed of the study but declined to take part. Participants all received an information sheet and verbal information about the study; all recruitment was based on voluntary informed consent.

Most of the fieldwork involved semi-structured individual interviews conducted by EM (a research fellow with prior experience of interviews, focus groups and qualitative analysis); each participant was interviewed once. Service providers were not present when homeless participants were interviewed and participants were not interviewed in front of their peers. Some alcohol service professionals requested a focus group for logistical and time-management reasons. Service provider topic guides included sections on alcohol and homeless service provision, homeless peoples' drinking behaviours and the RtS intervention. Drinker topic guides covered similar themes but focused more on the participants' own behaviours and experiences. We asked specifically about super-strength consumption, but also more generally about how drinkers would respond to restricted alcohol availability. Interviews were conducted in a private area in work settings or hostels, audio-recorded and transcribed. The researcher also made fieldnotes during and after each interview. Homeless participants received a £10 voucher as compensation for their time.

### Analysis

A total of 723 minutes of audio was recorded and transcribed; this figure excludes tours around five homeless hostels during which participants provided the researcher with background information. The first author coded the transcripts in NVivo 10 using the interview guide to group major themes; a second researcher double-checked the coding. We then utilised concepts from complexity theory to deductively code the transcripts. Specifically, we have used participant perspectives to identify theories of change – including participants' views on what constitutes potential intended and unintended consequences that could follow from the implementation of RtS.

## RESULTS

Thirty people participated in the study (Table 2). The nine alcohol-consuming hostel residents were predominantly male and seven had been in the hostel system for over a year. Six reported previous experience of rough sleeping. Four stated that they were regular (daily) consumers of super-strengths whilst others consumed it less frequently, preferring alternatives such as wine, vodka, or regular beer and cider. Twenty-one service professionals participated in the study, eleven in a focus group at an alcohol service centre and ten individual semi-structured interviews were conducted with professionals in other services.

**Table 2: Number of participants**

	Individual interview	Focus group	Males	Females
<b>Participants</b>				
Homeless drinkers	9	0	8	1
Alcohol service managers and staff	2	11	4	9
Hostel managers and staff	6	0	2	4
Street-based services managers	2	0	2	0

Utilising participant perspectives, we structured our analysis to consider different levels or domains at which the intervention constitutes an 'event' and where participants saw potential impacts stemming from the implementation of RtS. This includes the levels of the individual and service provision, as well as potential broader socio-cultural implications. The levels of the individual drinker (Figure 1) and service provision (Figure 2) were inherently built into our sampling strategy, whereas the broader socio-cultural context emerged from participants' accounts.

### FIGURE 1 ABOUT HERE

#### Findings at the individual level

Homeless drinkers and service providers presented a range of opinions about which groups they thought the intervention targeted, which included but was not limited to street drinkers, rough sleepers and hostel residents. More broadly, participants tended to assume that super-strength products were consumed by disadvantaged, middle-aged males with high levels of alcohol dependency described by various service providers as "problematic", "physically dependent" or "hardcore entrenched" drinkers.

Drinkers, and some service providers, had noticed the reduction of super-strength availability within the intervention areas and explained that only a limited number of shops continued to sell the products:

*I don't know if you're aware of that as well, but you know the strong lagers, i.e. the Special Brew and the Skol Super Light, all the 24 hours shops around here, all the police have completely stopped them from selling it, you can't buy any strong beers anywhere around here anymore. You know, except for a very select couple.*  
[Christopher, Drinker]

1  
2  
3 *now the Reduce the Strength campaign is in effect so a lot of these are no longer*  
4 *selling those brands that I just mentioned. However, there are still one or two doing*  
5 *it. [Luke, Street-outreach manager]*  
6

7 Participants discussed this substantial, but not absolute, restriction in super-strength availability as  
8 an event that could lead to a number of substitution responses. Drinkers described still being able to  
9 purchase super-strengths by switching from compliant to non-compliant shops. For example,  
10 Timothy described how super-strength drinkers walk a greater distance to find stores that continue  
11 to sell super-strengths:  
12

13  
14 *That's what everyone does at the minute, they walk out further afield to get it...they*  
15 *go into the shops that still do sell it, which is only like a handful, not even a handful, a*  
16 *couple of them. [Timothy, Drinker]*  
17

18 Drinkers disagreed about whether the necessity of walking longer distances would affect their  
19 purchasing behaviour. One said *"I'll walk as far as I can to get my same beer,"* [Max, Drinker]  
20 whereas others suggested there was a limit to the distance they would walk and this might vary  
21 depending on time of day. Service providers also reported seeing homeless and street drinkers, and  
22 alcohol-service clients still consuming super-strength products.  
23

24 A second substitution behaviour participants described was substituting drinks within compliant  
25 shops. Without prompting, several drinkers attempted to calculate the ways they could continue to  
26 consume the same number of units of alcohol within stores participating in RtS. Some suggested  
27 they would switch to drinks with higher alcohol contents, such as wine, sherry or vodka. For  
28 example, Christopher, a super-strength drinker, described how drinkers can still purchase vodka at  
29 compliant stores:  
30

31  
32 *You can't buy any strong beers anywhere around here anymore, except for a very*  
33 *select couple, but it hasn't deterred anyone though has it? Christ, yeah, cos they've*  
34 *still got bottles of vodka in there. [Christopher, Drinker]*  
35

36  
37 Other drinkers and service providers, however, questioned whether many homeless drinkers would  
38 be able to budget for the higher cost of a larger bottle of spirits (which were assumed to represent  
39 better value than smaller bottles) or make a bottle last longer than a day.  
40

41 Service providers also hypothesised that if a sufficient number of stores participated in the  
42 intervention, thus resulting in an absolute reduction in the availability of super-strengths, that  
43 drinkers might purchase greater quantities of cheaper, weaker beer or cider. However, drinkers  
44 largely rejected this idea as they perceived such drinks to be insufficiently strong to achieve a feeling  
45 of intoxication, or prevent withdrawal symptoms. One drinker called 'normal' strength beers *"a*  
46 *waste of time"* [Christopher] and another described them as *"piss water"* [Joshua].  
47

48  
49 Several drinkers and service providers also suggested that more drinkers would engage in alternative  
50 substance abuse, as many had histories of co-dependency. This could include illegal drugs or  
51 products not intended for consumption such as cleaning products or solvents:  
52

53  
54 *So I have one beer or one [butane] gas, but what I worry about there is once I've*  
55 *finished that beer, then I've probably by that time nearly gone through half of that*  
56 *one gas...When I really am getting anxiety attacks from the alcohol comedown and*  
57 *all that kind of stuff, the gas really douses it, you know? [Christopher, Drinker]*  
58  
59  
60

1  
2  
3 *I think the people who need alcohol and haven't got any money...can do extreme*  
4 *things [such as] drink a hand sanitizer in hospitals...I think it's a least bad thing if*  
5 *people can drink something that's at least commercially produced and safe. [Lauren,*  
6 *Alcohol service professional]*  
7

8 Participants acknowledged that purchasing more expensive drinks or alternative substances could  
9 result in unintended consequences for drinkers and perhaps the broader community should drinkers  
10 turn to crime or begging to obtain these products. One super-strength drinker, who distanced  
11 himself from these behaviours, argued that other homeless drinkers would “*try and blag or steal, or*  
12 *whatever it takes, you know to get it, as I said, it won't make much difference. [Kevin, Drinker].*  
13 Service providers also considered these possibilities, arguing:  
14

15  
16 *I think the other thing that would happen is that you could see offending go up.*  
17 *[Lauren, Alcohol service professional]*  
18

19 *If the money's not there they might turn to committing crime. [William, Alcohol*  
20 *service manager]*  
21

22 On the other hand, a hostel employee argued that any potential spike in more visible or risky forms  
23 of crime would only be short lived:  
24

25 *In terms of sustainability it probably depends on the risk associated with whatever*  
26 *they're doing. So things like pickpocketing is quite high risk because you're quite*  
27 *likely to attract the attention of the police and so that's probably not sustainable.*  
28 *[Peter, Hostel staff]*  
29  
30  
31

## 32 **FIGURE 2 ABOUT HERE**

  
33

### 34 **Findings at the service level:**

35 Within the complex system in which RtS is implemented, there are also consequences for service  
36 provision (Figure 2). The integration of RtS with existing homeless or alcohol services was a  
37 particular concern of service providers who largely saw the intervention as too limited to effectively  
38 address excessive alcohol consumption. Several participants attempted to reframe the problem  
39 away from alcohol availability and instead emphasised either psychological problems or wider social  
40 ‘causes’ of alcohol misuse such as poverty and homelessness:  
41

42  
43 *I don't think [RtS] acknowledges the psychological reasons why people drink, I don't*  
44 *think it acknowledges all the kind of needs that are being met, albeit in a*  
45 *maladaptive way by alcohol. [Adam, Hostel manager]*  
46

47 Service providers who were sceptical about the potential benefit of RtS did note that it might be  
48 used as a tool to engage drinkers who were already seeking help. For example, the intervention  
49 could be used to help talk to their drinkers reducing alcohol consumption in conjunction with  
50 support plans:  
51

52  
53 *it helps us because you could in your harm minimisation support plans say drink at*  
54 *different times, drink a lower strength beer, drink less amount and only go to that*  
55 *shop....if you know they're not selling strong drinks you can make it all part of the*  
56 *task-oriented support plan [Thomas, Hostel manager]*  
57  
58  
59  
60

1  
2  
3 Service providers tended to agree that in this particular roll-out of RtS, there was a missed  
4 opportunity for public services, including the alcohol services, hostel services and the council, to  
5 engage and interact more closely with the business sector. Some of these service providers had not  
6 heard of RtS and felt that explicit links between different stakeholders could have initiated positive  
7 changes. If implemented to encourage service linkage, RtS was seen as an opportunity to work more  
8 closely with local shop managers to assist dependent drinkers through alcohol supply regulation:  
9

10  
11 *I can't understand why we [the alcohol service] weren't asked to participate because*  
12 *we have a lot of volunteers and services that would have been able to contribute by*  
13 *going around to some of the shops as well because I think it's been about trying to*  
14 *get the shop owners to take responsibility for the community. [Eleanor, Alcohol*  
15 *service professional]*  
16

### 17 18 **RtS within the wider socio-cultural environment**

19 Participants also described how RtS may have implications beyond individual drinkers and service  
20 provision for homeless drinkers. Specifically, participants situated RtS within a broader socio-cultural  
21 context, of which they are a part, and described how the intervention may influence social norms  
22 around drinking. Participants also considered, as both individuals targeted by RtS and service  
23 providers working with that population, the ethics of social policies, such as RtS, that target specific  
24 groups of individuals  
25

#### 26 27 *Social change: making alcohol the new tobacco*

28 Service providers positioned the intervention within the broader culture of drinking in England. The  
29 participants argued that even if RtS had little immediate impact on local drinking behaviour, it might  
30 still contribute to a long-term process of social change and public awareness around alcohol-related  
31 harms. One hostel manager said that RtS could be "*part of a whole move of this awareness of how*  
32 *dangerous drink is. So I think it will have an effect but I think it's going to be part of a long term*  
33 *social change. I think in the short term it's going to be very patchy.*" [Thomas, Hostel manager]  
34

35 Several providers drew on the history of tobacco and argued that political action and interventions  
36 around smoking ultimately changed cultures around smoking, particularly around the public  
37 acceptability of smoking in public. Service providers saw parallels between tobacco policy and RtS:  
38

39  
40 *...and then the culture has changed as well...because the first place that*  
41 *implemented no smoking in public places was California and I think at the time in*  
42 *England the general perception was it was almost like a communist style, sort of*  
43 *undemocratic thing that would be unimaginable...[It] was a shock but then the*  
44 *culture changed and actually now everyone just thinks it's the norm. [Patrick, Alcohol*  
45 *service professional]*  
46

#### 47 48 *Ethical considerations of targeted policies*

49 Both service providers and drinkers believed RtS contributed to a broader strategy of  
50 targeting disadvantaged populations. Several service providers justified this targeting on the  
51 grounds that people who consume super-strength disproportionately use public services,  
52 cause anti-social behaviour and are vulnerable to environmental health risks:  
53

54 *...people that are actually dying or you know been affecting the community in a big*  
55 *way, I think those are the specific target groups that they're looking at. Those people*  
56 *that are actually impacting on the community, causing a lot of disruption, causing a*  
57 *lot of offending. [Jessica, Hostel manager]*  
58  
59  
60

1  
2  
3  
4 Amongst the drinkers there was confusion surrounding why super-strength drinks were targeted  
5 when other drinks such as spirits or wine have higher alcohol contents. Several homeless  
6 participants had the view that targeting the most disadvantaged with availability restrictions was a  
7 social injustice, and one hostel manager expressed concerns about how alcohol-related harms  
8 amongst more affluent members of the population were not addressed by the intervention:  
9

10  
11 *It's a bit unfair...the middle, upper class [have their] nose up in the air with a nice*  
12 *glass of claret or a glass of rosé or whatever, they drink as much as I do. So, please*  
13 *do not tell me I'm the only alcoholic [Kevin, Drinker]*

14  
15 *some people could argue it could be a bit of a class sort of thing really demonising*  
16 *poor people [Nathan, Hostel manager]*  
17

## 18 19 DISCUSSION

20 We have conducted qualitative research to obtain different stakeholder perspectives on the  
21 potential impacts of RtS following its implementation in a London borough. We have deliberately  
22 constructed a pluralistic account based on the understanding that the intervention is an event in a  
23 complex system. RtS is assumed to make both positive and negative contributions in advancing  
24 health and social policy goals relating to reducing alcohol harms.  
25

26  
27 Participants suggested that at the individual level, the target population were likely to adopt  
28 substitution behaviours to seek to reduce the impact of the intervention on their intoxication. Such  
29 adaptations could involve finding stores still selling super-strengths or continuing to shop at  
30 participating stores and substituting drinks, including drinks with higher prices. Recent research on  
31 dependent drinkers' purchasing behaviour in Scotland found drinkers seek the cheapest alcohol  
32 beverages from their local stores and adapt their purchasing behaviour based on price, the alcohol  
33 environment and drink preferences. The authors conclude that "heavy drinkers are astute, skilled  
34 and flexible shoppers".(34 p.1578) Our findings on substitution behaviours in response to RtS  
35 corroborate these conclusions. Participants also suggested, with some differences of opinion,  
36 responses around illicit drug and substance abuse, or crime and anti-social behaviours that could  
37 potentially affect individuals, retailers and communities.  
38

39  
40 At the service level, we found different viewpoints about how successfully the intervention had  
41 linked with other services. Some participants felt the intervention, as delivered in this local  
42 authority, had missed opportunities for service providers to engage with a range of stakeholders.  
43 However, some participants believed that RtS could offer opportunities for public and private sector  
44 stakeholders to strengthen or modify relationships in order to further encourage joined-up services  
45 to tackle deeply entrenched alcohol problems.  
46

47  
48 Participants also contextualised the intervention within a broader socio-cultural environment and as  
49 members of that culture, suggested how RtS may lead to broader cultural changes. Drawing on the  
50 history of tobacco policymaking, some participants suggested that local initiatives such as RtS could  
51 be a contributor to cultural changes surrounding the acceptability of harmful alcohol consumption.  
52 From this perspective, small interventions were considered to be important as part of a cumulative  
53 escalation of action and debate around alcohol: a different kind of impact to that normally  
54 considered by intervention effectiveness evaluations. As further evidence of this 'escalation', the  
55 Portman Group, a UK association funded by the alcohol industry, recently issued guidance  
56 discouraging the sale of single cans of super-strengths that exceed daily drinking guidelines for men  
57 and women.(35-37) However, both drinkers and service providers in this study highlighted how the  
58  
59  
60

1  
2  
3 highly targeted product restriction ignored other more commonly consumed alcohol products, and  
4 the problems of excessive drinking that exist across the whole population. Policies such as RtS may  
5 be seen as indicative of cultural associations of 'problem drinking' with more marginalised  
6 populations.  
7

8 Findings from our study add to a small body of research on highly targeted alcohol availability  
9 interventions. For example, in remote Australian communities where the sale of cask wine in  
10 containers over 4 litres was banned, mixed methods evaluations found that while there was  
11 significant substitution, either to other drinks or to other localities, that there was still an overall  
12 reduction in alcohol consumption not entirely offset by the substitution.(38-40) A UK study exploring  
13 public acceptability of policies to reduce alcohol consumption found participants repeatedly  
14 attempted to reframe problems related to alcohol availability in favour of a broader perspective that  
15 links alcohol harms with social and cultural characteristics and values. (41) Similar reframings can be  
16 found in some of the comments made by participants in this study. A related study found evidence  
17 of public concern that people who are sufficiently motivated will circumvent interventions,(42) a  
18 process which may encourage uptake of additional risky behaviours.(41) Our findings on individual-  
19 level responses corroborate these findings.  
20  
21

### 22 23 24 **Strengths and limitations**

25 We interviewed homeless alcohol consuming individuals who reside in hostels for pragmatic  
26 reasons, but recognise that other groups, such as rough sleepers and independent-living super-  
27 strength consumers, are also affected by the intervention. Our participants already engage, to  
28 varying degrees, with some services, by virtue of living within the hostel system. Drinkers who live  
29 independently, or are disengaged from services, may have provided different accounts of how they  
30 experienced the intervention. Informal discussions with implementers revealed that they felt they  
31 did engage with a range of alcohol and homeless services, whereas our findings from the service  
32 providers provide a different view. Future work could fruitfully bring together these perspectives.  
33

34 We utilised a single case study site. The choice between a single or comparative case study is to  
35 some extent a trade-off between depth of analysis in a single site and greater breadth that may  
36 result from multiple sites. Our sample, though small, was sufficient for us to generate multiple  
37 theorised pathways to impact including substitution behaviours and other responses to RtS which,  
38 we believe, can be plausibly considered by practitioners in other settings. We may speculate as to  
39 whether or not our findings covered all possible pathways (and so claim data saturation) but we  
40 have no clear way of determining this. Those pathways we did identify tended to recur in multiple  
41 interviews and gave us confidence that we had identified responses that appear particularly relevant  
42 for theorising potential impacts.  
43

44 Some of the participants' responses were grounded in direct personal experience, but some less so.  
45 Although the intervention achieved high levels of compliance from shops, participants reported  
46 being able to continue purchasing super-strength products with relative ease. Whilst this was itself  
47 an important finding, we also asked participants about their hypothetical responses, should RtS be  
48 implemented by all local shops. It might be assumed that when participants' responses are grounded  
49 in their experience this may constitute more powerful evidence than the speculative responses,  
50 although both shed light on how they perceive the intervention – both in its current form and in a  
51 hypothetical more full realised form – and both are subject to potential biases or may be interpreted  
52 as telling us more about how people represent themselves than how they actually behave.(43)  
53  
54

55 We have utilised interviews and a focus group to obtain participant perspectives on intended and  
56 unintended consequences following the implementation of RtS. Given the sensitive nature of the  
57  
58  
59  
60

1  
2  
3 topic, and some of the behaviours we asked about, there is a potential for social desirability bias.  
4 While we recognise this as a limitation that may have been addressed through the use of  
5 ethnographic methods, we also note that participants spoke openly about their experiences and  
6 behaviour, at times presenting themselves in a 'negative' light.  
7

8  
9 Whilst our study identified different types of substitution behaviours that could potentially be used  
10 to circumvent the intervention, additional qualitative and quantitative research is required to  
11 measure the extent to which different types of substitution occurred.  
12

### 13 **CONCLUSIONS**

14 The use of qualitative research methods has allowed us to create a pluralistic account of how RtS  
15 may affect the components of the system in which it is implemented, and has illustrated the  
16 mechanisms by which such changes may occur. We argue that the small scale of implementation  
17 and the limited range of products affected make it plausible that RtS could, by itself, make only a  
18 modest impact on alcohol harms. We base this on the apparent ease and willingness of drinkers to  
19 use substitution behaviours, including switching shops, drinks or substances in order to circumvent  
20 the availability restrictions. These individual responses are reactions to both the physical and  
21 economic dimensions of alcohol availability. An approach that ensured full shop compliance across  
22 larger geographical scales could restrict drinkers' ability to substitute to non-compliant shops. Hence  
23 we hypothesise that the local and voluntary nature of RtS could be barriers to effectiveness,  
24 although a well-conducted quantitative evaluation is required to test this.  
25  
26

27  
28 However, our systems approach has also encouraged us to consider effects on services as well as  
29 effects on individual drinkers. Although RtS in this local authority was seen as a 'missed opportunity'  
30 for service providers to engage with a range of stakeholders, some front line staff believed that RtS  
31 has the ability to facilitate new forms of engagement between public and private sector interests  
32 and promote further awareness of alcohol harms. Hence, some stakeholders suggest that a small,  
33 local intervention such as RtS can potentially contribute to wider system changes irrespective of, or  
34 indirectly related to, the intervention's effectiveness in achieving its formally stated goals.  
35

### 36 **ACKNOWLEDGEMENTS**

37 We would like to acknowledge Professor Mark Petticrew for his helpful comments on this paper.  
38

### 39 **FUNDING STATEMENT**

40 This work was supported by the National Institute for Health Research (NIHR)'s School for Public  
41 Health Research (SPHR). The views expressed are those of the authors and not necessarily those of  
42 the NHS, the NIHR or the Department of Health.  
43

### 44 **DATA SHARING STATEMENT**

45 No additional data available.  
46  
47

### 48 **COMPETING INTERESTS**

49 DM is a joint Public Health Strategist/Lecturer covering the intervention area. At the time of writing,  
50 CS was a Public Health Strategist in the intervention area and was involved in developing, supporting  
51 and evaluating the work discussed in the article.  
52

### 53 **CONTRIBUTORSHIP STATEMENT**

54 EM (MSc) conducted the interviews and focus group, led on the analysis and drafted this manuscript.  
55 ME (PhD) contributed to the analysis and to the manuscript draft. EM (MSc), DM (PhD), CS (MSc),  
56  
57  
58  
59  
60

ME (PhD) have provided input into data interpretation, critically revised the manuscript and approved the final version.

No Item	Guide questions/description	Reported on Page #
<b>Domain 1: Research team and reflexivity</b>		
<i>Personal characteristics</i>		
1. Interviewer/facilitator	Which author/s conducted the interview or the focus group?	Page 5
2. Credentials	What were the researcher's credentials? E.g. PhD, MD	Page 13
3. Occupation	What was their occupation at the time of the study?	Page 1 and 5
4. Gender	Was the researcher male or female?	Page 1
5. Experience and training	What experience or training did the researcher have?	Page 5
<i>Relationship with participants</i>		
6. Relationship established	Was a relationship established prior to study commencement?	Page 5
7. Participant knowledge of the interviewer	What did the participants know about the researcher? e.g. personal goals, reasons for doing the research	Page 5
8. Interviewer characteristics?	What characteristics were reported about the interviewer/facilitator? e.g. Bias, assumptions, reasons and interests in the research topic	Page 5
<b>Domain 2: study design</b>		
<i>Theoretical framework</i>		
9. Methodological orientation and theory	What methodological orientation was stated to underpin the study? e.g. grounded theory, discourse analysis, ethnography, phenomenology, content analysis	Page 3-4
<i>Participant selection</i>		
10. Sampling	How were participants selected? e.g. purposive, convenience, consecutive, snowball	Page 5
11. Method of approach	How were participants approached? e.g. face-to-face, telephone, mail, email	Page 5
12. Sample size	How many participants were in the study?	Page 5-6
13. Non-participation	How many people reduced to participate or dropped out? Reasons?	Page 5
<i>Setting</i>		
14. Setting of data collection	Where was the data collected? e.g. home, clinic, workplace	Page 5
15. Presence of non-participants	Was anyone else present besides the participants and researchers?	Page 5
16. Description of sample	What are the important characteristics of the sample? e.g. demographic data, date	Page 5-6
<i>Data collection</i>		

17. Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	Page 5
18. Repeat interviews	Were repeat interviews carried out? If yes, how many?	Page 5
19. Audio/visual recording	Did the research use audio or visual recording to collect the data?	Page 5
20. Field notes	Were field notes made during and/or after the interview or focus group?	Page 5
21. Duration	What was the duration of the interviews or focus group?	Page 5
22. Data saturation	Was data saturation discussed?	Page 12
23. Transcripts returned	Were transcripts returned to participants for comment and/or correction?	No
<b>Domain 3: analysis and findings</b>		
<i>Data analysis</i>		
24. Number of data coders	How many data coders coded the data?	Page 5
25. Description of the coding tree	Did authors provide a description of the coding tree?	Page 6
26. Derivation of themes	Were themes identified in advance or derived from the data?	Page 5-6
27. Software	What software, if applicable, was used to manage the data?	Page 5
28. Participant checking	Did participants provide feedback on the findings?	No
<i>Reporting</i>		
29. Quotations presented	Were participant quotations presented to illustrate the themes/findings? Was each quotation identified? e.g. participant number	Page 6-10
30. Data and findings consistency	Was there consistency between the data presented and the findings?	Page 6-10
31. Clarity of major themes	Were major themes clearly presented in the findings?	Page 6-10
32. Clarity of minor themes	Is there a description of divergent cases or discussion of minor themes?	Page 7-8
